my speakers when:

I try to save SCSI info in diamond edge
I try to start SETUP going (from the MINT install kit)
or when I access any of the three lowest "help" menu items from SETUP.

So, any ideas? All other things seem to work OK, so far - these are
the only times the problem occurs.

Thanks,

hello. i'm working on a real time data logging modification to some data acquisition software and we need to log stuff directly onto a disk partition on our TT. we are using megamax C, and have run into a problem with Rwabs only being able to address 32767 blocks (ie. 32 megs)

is there code out there to do the equivalent of direct sector read-write beyond this 32 meg limit?

thanks in advance
vic spicer

I saw a couple files on GEnie that might apply. There's JAGUAR.GIF
which is a picture of the Jaguar console...

There is also DD_TRGAS.ZIP which I think are TGA screenshots of
"Evolution Dino Dudes" for the Jaguar...

There is also RA_TRGAS.ZIP which I think are TGA screenshots of
"Raiden" for the Jaguar...

There is also TT_TRGAS.ZIP which I think are TGA screenshots of
"Tiny Toon Adventures" for the Jaguar...

If they're not on atari.archive, I'll try converting them to JPG
and then uploading them (the JPGs would be significantly less space,
and since TGA and JPG are both 24bit, there won't really be a loss
of quality)...

....(much deleted)
> Again I do the same.

Well, obviously something/somebody have changed your battery-backed up (NV-RAM)
configurations... The Falcon has a Bttery backed-up memory that saves your
boot-up config and it also consists of info on what language you want to use,
and what your keyboard-layout is! All you have to do is to get a program like
NV-RAM 1.1 (CPX) or BootConf (PRG) and simply change back both keyboard and
desktop to english!!!

Julian Reschke hacked the following on 27 Sep 93 (to All)...

> From: reschke@math.uni-muenster.de (Julian Reschke)
> Hm, are there different versions of Chkdsk3? Mine can't access the root
> sector.

Edit Disk sector
F1 (Drive/Unit)
Drive/Unit: //your desired HD-number, 0,1,whatever
(Hex) Absolute sector: //physical sector number, 0 for boot sector

Then you'll have to scroll the cursor down a bit to make the end of the sector visible where the partition table is (starts at offset +1C6).

(Maybe we should add this to the FAQ?)

Your Falcon has a number of different languages and keyboard configurations stored in its internal ROM. To make it boot with the correct language of your country, there's a small battery backed memory inside that preserves the chosen preferences. Some program that you were running must have altered this memory so now you have to restore the original settings. You can do this with serveral PD programs like BOOTCONF.PRG or NVRAM.CPX. I believe both these programs can be found on atari.archive.umich.edu or ftp.uni-kl.de. Set it back to English (=USA) again and reboot. Don't mess with the monitor (RGB/TV or VGA) options though, unless you know what you're doing!

Congrats to your new Falcon btw!

4889. GE-Soft SCSI & Quantem ELS drive

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-30 07:49:37 UTC
From: yammouni@vaxc.cc.monash.edu.au
Message-ID: <1993Sep30.174937.92742@vaxc.cc.monash.edu.au>
Source record: 36510

Hi All,
I hope that someone can shed some light on a problem I have. I
recently purchased a GE-Soft scsi adaptor from Gasteiner in U.K. and I'm
wishing to connect it to a Quantem ELS 127 meg hard drive. My questions are:
1) The ELS drive cannot disable parity - will this cause a drama?
2) Has anyone got a configuration like this - if so, what hassles have you had?

My set-up consists of a 1040 STFM that has a Frontier 4 meg. RAM upgrade
fitted. Any help would be immensely appreciated.

Regards
David Yammouni

It _is_, but maybe you've got to do something with pin 2 of the drive, which tells the controller about the density of the disk in use. Don't remember exactly what you've got to do, but I've had a Teac FD235? running as a 720K drive and _it worked_.

That's not only a question of what compiler you use, but also one of
which library you use. Don't know about the Gnulibs, only about the
Mintlibs, but maybe you should use an older version of the libs.
GCC 2.3.3 and Mintlibs 30 do quite ok...

4893. How to connect a NEC-II to an Atari STF?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-30 12:09:52 UTC
From: alberts@cs.utwente.nl
Message-ID: <1993Sep30.130952@cs.utwente.nl>
Source record: 36493

Recently I purchased a second hand NEC-II monitor. I would like to connect it to my STF. Does someone have a diagram of the cable (13-pin ST-connector with 9-pin monitor connector) required to establish this connection? Are the video signal levels of the NEC-II and the ST the same, or do I need some voltage adapter?

Regards,
Mert.

4894. Malloc under Mint, (was: Re: Mxalloc()...)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-30 12:18:48 UTC
From: itschere@techfak.uni-bielefeld.de
Message-ID: <CE627C.GMA@hermes.hrz.uni-bielefeld.de>
Source record: 36494

There's this problem I've had - and am having - which I can't track down
so I'd like to place it to the public:

I've written a small program which allocates as much memory blocks as it
can get, and then tells me about the sizes and adresses where it found
these blocks. The effect is that you see how fragmentated the memory is.
Well, I know, this method _can_ fail in multitasking systems, but let's
assume it _doesn't_ (as long as I am superuser I can kill all other proggies
so that nobody else claims memory).

When you start the system, it look like:

2814K at $XYZXYZ

Then you start multiple programs, e.g. mgr, gcc, some shells or what
you like. You play with them as long as you like. Then you leave all
programs regularily and look for the memory, which then looks like:

8K at $100000, Gap 16K
32K at $106000, Gap 96K
8K at $20????, Gap 8K
960K at $... and so on

See: All programs are terminated, so all memory should be free again, and
it should be free in one large block. Well, it isn't, and that makes me
wondering about the story, and sometimes forces me to reset my machine
because there isn't enough memory (in one block) left to run gcc.

May there be a but in MiNT's memory managing stuff, or may there
be other intelligent ideas???

Oops, it should be able to do so...
Are you using an Atari compatible harddisk driver?
If so, maybe just the Megamax doesn't support the extended rwabs mode.
This one uses an additional "long" parameter (lrecno) which is used as
the start sector if the normal one (recno) is set to -1. Think you'll
have to re-define the rwabs with this additional parameter.

Source record: 36496

> I have a question (and possible request). Is there any resolution
> limitation when using DEGAS files? That is, could I create a 320x400x16

DEGAS images limited to the ST resolution (P?[1-3]). After the TT 3 new
DEGAS formats exists, which are not supported by GEM-View!

> My other suggestion: I know I can halve the size of a picture and
> double the size. Have you given any thought to including a RESIZE
> option where an *arbitrary* resolution could be resized to (say I wanted
> to resize a 800x600 GIF to 640x400).

In the new version of GEM-View you can switch between relative ZOOM (meens
you put in the percentage of zooming, also in all version of GEM-View) and
absoulut ZOOM (meens you put in the destination size).
Therefor hold <ALTERNATE> if you choose "Load image..." and select the
image to load. A dialog opens. The zoom option is in this dialog (some
other options in the parallel dialog, RASTER-Button). Put in the
destination size and select "absolut"! If you want to save this image
without processing choose the destination format (right to "mono", "color"
or "true-color") and click the button of the the destination form (mostly
"color"). If you only want to convert the image without seeing it click to
"Do not show". Some additional processing options you can find in the
parallel dialog ("RASTER") the installed options will used before saving
the image!

Ciao
Dieter

P.S.: A Quiz! How you can clip, brighten and save an 256 color image with
its original colormap on ST-low (or other 16 color screen
resolution)?
BTW. It is possible with GEM-View >= 2.30! * *

4897. Call for help with minix filesystem

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-30 15:48:50 UTC
From: aeg03@rrz.uni-koeln.de
Message-ID: <28ev52INN2jtm@rs1.rrz.Uni-Koeln.DE>
Source record: 36498

Hello folks,

I have recently downloaded the minix filesystem from
src.doc.ic.ac.uk (mirror of a.a.u.e), to use it with my system:
TT with 8 MB RAM (4 ST/ 4 TT), 50 MB hard disk, Syquest drive,
TOS 3.06, MultiTOS. As a first test, I tried miniting a floppy,
as suggested in the docs. This seemed to work ok, except I
couldn't find out how to minit a HD floppy -- minit A: would
always minit 1440 blocks, 480 inodes, and specifying larger
numbers of blocks (-b option) caused minit to think the disk had
more tracks, not more sectors per track. The result were awful
squeaks from the disk drive. Does anyone know how to minit HD
disks?
Next, I tried to minit a partition on a Syquest medium. The
partition size was about 20 MB, so it should be type BGM, if that
matters. It minited ok, and I could put the gnuplot tar.gz file
on it and restore the original Unix filename of that. But
suddenly my system hung without any apparent reason (I think I
was doing an ls). I rebooted, and since then, the system always
hangs when trying to list the files on the minix partition (F:).
I confirmed it was ls that causes the problem by starting it from
the MultiTOS desktop and specifying "F:" as the commandline
argument. I downloaded the current version of the file utils
(futilbin.zoo), but that turned out to be futile -- no
differences to the utils I already had installed. Of course, I
disabled all accessories and auto folder programs that are not
absolutely necessary early in the process.
Any ideas what may cause my system to hang when doing a ls on
this minix partition? The system simply dies, tcsh doesn't even
get around to actually display the return after ls. fsck F: does
not report any problem, fsck seems tobe perfectly happy with the
partition.

Many thanx in advance.

Greetinx, Jan

^^

Really? Where can you buy HD floppies cheaper than DSDD ones? Gee, I really do have to get out more. :)

At any rate, if you really want a 1.44Mb floppy drive, I'd say the easiest way would be to buy an external floptical drive and ICD Link interface. You could then not only read and write 1.44Mb floppies but 21Mb flopticals too. This might not be the cheapest solution, but it would work.

I don't think it's possible to install a 1.44Mb floppy in an ST because the ST's disk controller wouldn't recognize it. Others will quickly correct me if I'm wrong, no doubt. :)

Source record: 36500

THis might be a really silly thing to say (and I am sorry if you already thought of it) but have you copied the minix.xfs file system to your boot drive so that MultiTOS will load it when booting?

I have a Falcon with M/TOS and F: as a Minix drive and I have no probs running tcsh or any other program from or to F: .

If this helps...all well and good.

By the way...try the resizable ramdisk xfs. Its really good.

>Hm, are there different versions of Chkdsk3? Mine can't access the root sector.

Try pressing a numeric key instead of a drive letter when the sector
editor prompts for "Drive/Unit"; next, it will ask for an _absolute_
sector # instead of a logical one.
Unfortunately, there seems to be no way to specify a unit adress
above 9 - you can only access ACSI devices 0 thru 7 and SCSI devices
8 and 9; you can't access IDE drives (unit 16 and 17, I believe) at all!
CHKDSK3 is a little bit out of date, it seems... :-)

4904. disk acess with VBI's running, is this a problem?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-09-30 23:15:47 UTC
From: wilsont@rahul.net
Message-ID: <CE6wMC.MEv@rahul.net>
Source record: 36505

I'm writing a program on the Falcon030, i set up a VBI to color cycle
the palette.

But it seems that when i start doing file accesses in the main loop...
(fopen, fread(500k), fclose)

it crashes. (sometimes after 7 file accesses, sometimes 20), but always
during a file access.

I've heard of some sort of bug/limit with nested xbios calls (3 max)
but i can't figure out how i could be getting 3 calls to nest.

i tried saving registers at the beginning of the VBI as well, but no luck.

Perhaps the problem lays in how i wrote the VBI routine, what are its
limitations, or what shouldn't i do in a VBI?

can I do the file access somewhere else? perhaps on another interrupt?

Your help is greatly appreciated!

Thanks.

Assume you want to run D:\FOLDER\PROGRAM.PRG automatically, then put

run D:\FOLDER\PROGRAM.PRG

into the gem.cnf file. Note that "run" seems to be recognized properly
only when typed in lowercase. This is especially silly as in my sample
gem.cnf file it said "Use RUN programname to automatically run programs
at startup" in some comment.

4906. Need help with Mint installer and setup prog on Falcon...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-01 01:39:14 UTC
From: kendall@flammulated.owlnet.rice.edu
Message-ID: <KENDALL.93Sep30193914@flammulated.owlnet.rice.edu>
Source record: 36509

Ok, I've tried running the Mint setup and installation programs on my Falcon, but neither one works!! Has anyone else run these OK on a Falcon?

I'm running both programs under Multitos. When I try the "do setup" menu option in setup or the "do install" option in Install, Multitos dies saying that an error in AESSYS killed it, and to up the debug level and try again.

So, has anyone else had these problems? Also, I'd like to increse the Multitos debug level, so what do I have to put in my mint.cnf file to do that?

Thanks,

4910. ACCS From Desktop Under MTOS

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-01 10:06:46 UTC
From: mm68@unix.brighton.ac.uk
Message-ID: <1993Oct1.100646.1590@unix.brighton.ac.uk>
Source record: 36512

Has anyone got an accessory to run from the desktop by double clicking on it as the (prelim) MTOS manual suggests? I have got them to run through tcsh but not from the desktop.

Replies by email would be handy because I cannot get access to a terminal regularly enough to read replies.

Thanks in advance

I think the problem lies in the fact that you call the XBIOS from an interrupt.
Normally you are not allowed to call any operating system function during any
interrupt unless explicitly allowed; so it might be a good idea to access the
screen driver hardware directly to make the color map changes.
BTW: if you are calling the XBIOS or not, you are not able to run your code
on a graphics card.

From: jbww@ukc.ac.uk
Message-ID: <5955@eagle.ukc.ac.uk>
Source record: 36515

Re: compiling Mint 1.08 :

Thanks to those that sent me suggestions as to fixes; the answer
is as follows, and was in the README.bin docs in the mint olibs
- I just had to work out which case applied to my set up :

" So you must either use the "-mint" flag when linking, or rename
the files to the "standard" names gcc is looking for. "

thus in the makefile had to be edited thus :

CFLAGS = -mint -G -Wall -O2 -fomit-frame-pointer $(MODEL) $(DEFS)

It now flies nicely.

cheers,
beau webber

What programs are these exactly? Do you mean the MTOS install program from Atari?
The MiNT distribution kit?

4916. Need HELP with C Function

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-01 15:03:40 UTC
From: walkerd@maccs.mcmaster.ca
Message-ID: <1993Oct1.150340.7288@mcshub.dcss.mcmaster.ca>
Source record: 36518

Would some C programmer be kind enough to help me? I need to reconfigure my RS232 port (on an STFM1040). I plan to use a utility to do this, but the only instructions on the SETTINGS I need are contained in a C function call that I can't parse (I don't program in C on the Atari and don't have a manual).

The call is :
Rsconf(5, 0, 8, -1, -1, -1)

Can someone tell me what the parameters are specifying? (I bet the function call means something like "RS232 Configure" :-))

Thanks,

I've had no problems doing this. Have 2 1.44mb Teac's running in an external case using a home brew din -> header cable. This has been running for about 3 years now. I did nothing to the drives but plug 'em in, so I'm not sure any jumpering needs to be done. May depend on the specific drive type etc...

So you always have the latest version of MiNT installed as part of
MultiTOS, I'd imagine. For instance, to make MiNT 1.08, you might
want to have the Mintlibs, etc. Using the installation program may
seem easier than tracking everything down. Since MiNT is also part
of MTOS, this would be like upgrading yourself...

Also, as I recall, the MiNT setup program was written in GFA BASIC
which is not (as far as I know) Falcon compatible.

Ahh, I didn't realize that.

Well, although it does sound odd, I really wanted to have the install
program do everything for me - set up the minix partition, and install
everything like gcc, shells, utils and everything else. I guess I'll
have to do it by hand...

Is there a description anywhere of how and where it sets up the
directory structure? I guess I can just look at the files that
install uses to determine where to put each of the individual
packages, but I would like to know what stuff Setup does, so I can
just go and do it myself. I'm pretty familiar with UNIX, so I should
be able to figure most of out myself, right? :-)

>The call is :
> Rsconf(5, 0, 8, -1, -1, -1)

>Can someone tell me what the parameters are specifying? (I bet the
>function call means something like "RS232 Configure" :-))

Declaration:
long Rsconf(int speed, int flowctl, int ucr, int rsr, int tsr, int scr)

Call:
rsret = Rsconf(speed, flowctl, ucr, rsr, tsr, scr);

Parameters:
speed: 0 = 19200 baud
1 = 9600
2 = 4800
3 = 3600
4 = 2400
5 = 2000
6 = 1800
7 = 1200
8 = 600
9 = 300
10 = 200
11 = 150
12 = 134
13 = 110
14 = 75
15 = 50
flowctl: bit 0 = XON/XOFF, bit 1 = RTS/CTS
ucr, rsr, tsr, scr: values for the corresponding registers of the MFP. If one
of the values is -1 (0xFFFF), the corresponding value isn't changed.
rsret (d0): the values of the ucr-, rsr-, tsr- and scr-registers, in d0.
ucr in the highest byte, scr in the lowest.

Remark:
Starting from TOS's from 1988, Rsconf(-2,-1-,1,-1,-1,-1) gives the current
baudrate.

You can:

* stick a 1.44M floppy _drive_ into an unmodified ST and use it as a 720k
drive

* stick 1.44M floppy _disks_ in 720k drives and use them as 720k disks
(if you do this, you may need to stick tape or something over the other
hole for PCs to be able to read them properly; some have real problems
reading a 1.44M floppy that's been formatted as 720k)

4926. my st has started freezing randomly. what can it be?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-02 20:59:28 UTC
From: jacob@max.cc.brandeis.edu
Message-ID: <1993Oct2.205928.18073@news.cs.brandeis.edu>
Source record: 36528
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

alas there's no end to my st woes...

my st has started freeze-crashing randomly. average uptime now is about
4 minutes.

it crashes even when it sits there waiting for input from the keyboard
(i know that because it also crashes in a program of mine)...

it crashes with the desktop sitting there...

it crashes when running a midi sequencer that goes between memory and
midi port like crazy...

when say it crashes i mean it just freezes there. when i try to reboot
it (cold or reset) it does _not_ always reboot. i've had to open the
case and wiggle things around which makes me think it's a loose contact
somewhere.

on there other hand it crashes with _nothing_ perceptibly moving in the
room. a loose contact _would_ have to be produced by some movement would
it not?

sure expansion due to heat generated could be something creating a loose
contact. but in 4 minutes?

does any of this give you any idea? thanks (preferably email)

cheers.
jacob

for additional input here's the history of that poor st:

i've had it since 1986 w/o any problem (but only 512 k)
this summer i've had it upgraded to a newer version of tos and 4 megs.
fiy the works was done by toad computers down in severna park, md

when it started crashing about a week ago i opened the case and first
saw that the work didn't seem to me to be of the very highest quality.

the board carrying the 4 megs is just loose inside the case, there are
a few miles of extra ribbon cable between it and the two points where
it attaches to the mother board (one place is right next to the 68000
the other close to some other chip i haven't identified) and that ribbon
cable is besides twisted like a moebius band. (isn't there ribbon cable
that changes orientation? do you have to use this "twisting" thing
inside a crowded case?) furthermore the new memory board was grounded
to where the television thing is (the thing that allows you to plug

a tv monitor into the atari and used it as a terminal) and so poorly soldered that the ground broke. amusingly enough the atari kept on working (just as intermittently) with _no_ ground... (what the hell is going on?)

Mxalloc() really allocates memory.

>

Yes, GEMDOS will return an EINVFN error (invalid function number) when there's
no Mxalloc().

>ICD format?

If you don't have 5 or more partitions on your HD, it's Atari compatible
anyway. Otherwise, you'll have to repartition (thus erase) it.

bye, Peter

4934. Re: Call for help with minix filesystem

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-02 22:56:14 UTC
From: aeg03@rrz.uni-koeln.de
Message-ID: <28l0ueINNv9h@rs1.rrz.Uni-Koeln.DE>
Source record: 36530

From additional messing around since I wrote my first posting
with this subject, I found out that the version of ls I have has
the silly problem that it hangs the system when there are files
with long filenames in minix filesystems. So I downloaded the
sources of the file utilities and compiled them. I had to
truncate a few file names to get things compiled, and I removed
cp and install from the makefile in ./src because they gave
"Undefined symbol referenced from text" errors. Finally, I got
another ls made. This one doesn't crash upon encountering long
file names at least, but it truncates them to 8+3 type file
names. It obviously uses the 8+3 names internally, as it
displays identical file sizes for files that have the same names
after truncation.
So, what all this seems to boil down to is: Could anybody point
me to an archive of file utilities that are known to work with
minix filesystems? Or can anybody tell me what caused the ls
compiled by myself to do the filename truncation?

Greetinx & many thanx in advance, Jan

>I don't get it... Why try and install MiNT when you are running
>MultiTOS???

So you always have the latest version of MiNT installed as part of
MultiTOS, I'd imagine. For instance, to make MiNT 1.08, you might
want to have the Mintlibs, etc. Using the installation program may
seem easier than tracking everything down. Since MiNT is also part
of MTOS, this would be like upgrading yourself...

Yes - this is exactly what I wanted to do...

So, can anyone out there perhaps even just send me some of thier
mint.cnf and gem.cnf files, as well as directory setup?

Also, is there a list anywhere of MultiTos variables? For instance, I
now know of two - SHSHOW, which I believe should tell MultiTos what
program to use to display text files (although I suspect it of the
much more henious ability to define how the output from all TOS
programs is routed - after I tried it, tos programs just fail to
run...)

Another more useful one is the line "SLICES=3" in my mint.cnf file,
that improves the response of topped applications...

In both cases, I learned of these from other programs docs (the SLICES
one was from Photoshow - thanks guy(s)!!)

Perhaps I'll just download the source and page through it myself to
look for these.. But I would like to get my whole system set up to
try and compile 1.08.

Thanks,
--

>available?!?

These are the ones I know about:

comp.sys.atari.st : general stuff about the ST
comp.sys.atari.st.tech : more technical stuff about the ST
comp.sys.atari.advocacy : alot of the arguments of pros and cons about
the Atari (I suppose the correct place to put
the flame wars)
comp.binaries.atari.st : supposed to have binaries posted on it uuencoded
but hasn't been used much in awhile (from what
I can tell, anyways)

I've found the top 2 to be most useful to me. Oh, the descriptions
of the groups are my own; the FAQ for the groups would probably be the
best place to see the actual purposes of each group.

If I'm off on any of this, I'm sure someone will let me know :-)

In modern Atari times that is no longer correct.

ucr : bit 1 : parity type (0-> odd, 1->even)
bit 2 : parity (0->disabled, 1->enabled)
bit 3..4 : stopbits (00->invalid, 01->1, 10->1.5, 11->2)
bit 5..6 : databits (00->8, 01->7, 10->6, 11->5)
other bits must remain unchanged!
tsr : bit 3 : set to send break
other bits must remain unchanged!
rsr,scr : always -1 (no change)

> rsret (d0): the values of the ucr-, rsr-, tsr- and scr-registers, in d0.
> ucr in the highest byte, scr in the lowest.

As I recall, these last two wouldn't work in older versions of TOS due to a bug in TOS. Anybody know if/when this was ever fixed? (Or whether I'm just blowing smoke? Of course, it's not the sort of bug most people would have reason to notice, but, well, every bug counts, as they say.)

This will NOT work properly, as the magnetic material of HD disks is different
to DDs. It needs a higher magnetic current for writing bits properly.
It MIGHT work in some cases, but these disks will very soon lose data.

bye, Peter

Have a look at the Atari Profibuch, German version, 1991 :-).

The dutch translation is based on the original publication in 1987, there
were no TT and Falcon at that time. The older ST models had only one serial
port using the MFP 68901, the TT and Mega STe have additional serial ports
contolled by an 85C30. Assuming that the ucr, rsr, tsr and scr parameters
of Rsconf() refer to the equivalent MFP registers is incorrect.

4946. GEM++ and AMS Class Libraries (C++)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-03 23:04:06 UTC
From: cherborth@semprini.waterloo-rdp.on.ca
Message-ID: <H.eg.y6oXqoanOE_@semprini.waterloo-rdp.on.ca>
Source record: 36405

Warwick's GEM++ and AMS class libraries have been available for a while now; I'd like to know if there are other people out there using them? I wouldn't call myself a user yet, since I'm still learning C++ (the syntax is no problem, but OO design is quite a challenge).

I'd also like to start some discussion about some things that need to be done; for example, we need a GEMTextWindow and a GEMCursesWindow class to make porting text applications to GEM easier. We also need to bug Warwick so he'll write some 'How-to' articles about AMS and GEM++... ;-)

GEM++ GEMTextWindow class

IMHO, a GEMTextWindow should be a kind-of ostream, so you can do this:

```
GEMTextWindow main_wind;
[...]
main_wind << "This is the main window!\n";
main_wind << some_mutant_class_with_an_operator<<_for_ostream;
```

GEMTextWindows also should support any font available; I've done some work on creating a class for GDOS fonts and a font selector like the standard fileselector.

A GEMCursesWindow class will build on a GEMTextWindow and the CursesWindow class; this would probably be rather ugly for proportionally spaced fonts, unless we treated them as monospaced fonts (there should be an ios-style bitflag for this option).

GEMCursesWindow should also have operator<<; I'm hoping to get some time to add an operator<< to the CursesWindow class (which is just a C++ wrapper for the standard curses library functions)... perhaps an operator>> as well.

Comments? There are probably some things that should be added to AMS as well, and Warwick is currently working on that class library; maybe he'll add the icon classes he used for the GEM NetHack.

I've encountered a serious problem with my Falcon: Sometimes when I try
to Upload file to BBSs all I get is a hell of a lot of "syncing". It works fine
for a few seconds, but then the program starts reporting "sync on xxxxx" where
xxxxx of course is the number of bytes I've uploaded so far. The reporting
occurs about every 2Kb and the "time left" indicator keeps increasing... The
CPS rate goes from around 3500cps to 200cps and after a while the transfer is
stopped... I'm using a SupraFAX v32" modem, a Falcon and CoNnect. I've tried
using both the internal CoNnect Zmodem protocol and external ones such as XYZ
and GSZRZ...it doesn't help! I've tried setting my serial port to both 19200,
38400 and 57600...Nothing helps! Could there be a need for a serialfix? I've
tried using "Serialfix v2.0" but it doesn't work.... Note that downloadibng is
not a problem at all, it works perfectly...and I don't believe it's due to a
bad
connection since I've encountered the sam problem on several BBSs close to
me... Anyone got any ideas???

>> Then you'll have to scroll the cursor down a bit to make the end of the
> sector
>> visible where the partition table is (starts at offset +1C6).
>
> Thanks, I didn't know that you can specify a harddisk number :-)

=id-number, since you could (originally) have up to 8 different devices on the DMA bus. Sadly checkdisk breaks down with TT and Falcon, since more id-numbers are possible then, eg the F030 IDE has id#16 I believe. There are some other inconveniences with checkdisk v3 too, but despite that I've found it a reliable and useful hack, at least when one has a fairly straight-forward harddisk setup.

Over the years we've often had occasion to wish for a few lines of documentation along with the sundry utilitites "released" from Atari (not actually, just internal hacks uploaded somewhere by Atari employees who've realized the need and done something about it).

Perhaps checkdisk v4??? :-)

4950. changing TT's SIMM's 4Mb->16Mb

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-04 08:36:01 UTC
From: mluoto@plootu.Helsinki.FI
Message-ID: <28on9h$7ta@plootu.Helsinki.FI>
Source record: 36403

BAckground:
I've got older model TT, that is, it's got metal-faraday inside
(no ferric paint) and has an ATARI TT-RAM board that has four standard
SIMM slots and three jumpers (W0-3 I bellive)...

I've heard of numerous succesfull simm replacements and what's common
between them is that only from 4mb to 16 (replacing 1mb simms with 4mb
ones) seem to have worked... now the questions are...

QUESTIONS:
What speed should I have (which ones work ?) the old ones were
100ns as it red -10 in the IC's

Could I use standard pc-simms with 9 IC's (that is 9bit) and if
so, what jumpers should I set and how ? (or maybe dip switches ?)

Or do I have to get 8bit (8IC's) simms as the original ones to
get it to work ? and if so what jumpers / dips and how ???

ANY OTHER SUGGESTIONS ??
HAS ANYBODY HERE IN THE NET DONE IT ?

I'd appreciate e-mail also... (you may post but my newsreader isn't
allways there...)

thanks !

4951. Fast efficient Sprites

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-04 10:41:00 UTC
From: mike.hill@cccbbs.UUCP
Message-ID: <387.265.uupcb@cccbbs.UUCP>
Source record: 36421

All,

Some friends and I are working on a game that will require heavy use of "sprites" (I know the ST doesn't have true sprites). We encountered a speed problem at this point. Im not totally fluent on the graphic issue (Im the only one with Usenet access) but I will try to describe what we are doing.

We currently have two screens we work with. While the computer is displaying one screen we draw our background on the second, and then draw all of our sprites (we are using masks on each sprite also so the background patterns dont "mix" into the sprite). We then switch the ST screen over to the second screen to display it (Setscreen). Then we repeat this loop but now load the background pic onto the first screen (the st is still displaying the second screen) and draw the sprites on that screen and when done setscreen to that screen. This seemed to give us the smoothest "Flicker Free" display.

The problem is the sprites just dont move as fast as we would hope. We are doing this with 100% VDI calls no Line A.

Does anyone have any thoughts,tips,ideas,etc on a better approach to fast flicker free sprites? The game when finished will probably have about 16 sprites on screen maximum.

Also any info on a good program for creating sprites (hopefully there is something compatible with Graphic cards and Falcon TT Rez's). Right now we are using GLEE which works reasonably well for ST rez's but doesn't allow you to draw sprites, just import in a pre drawn picture and pull your sprite from it.

Any comments or feedback would be appreicated. If replies could be sent to my email address below I would appreciate it. I can summarize it here if there is interest.

Hi!

Do you use something like BlowUP030? i've got the same errors, when I use
BlowUP030 and the screen-saver is active. In each other case, however,
uploading is quite OK.

Maybe you should also use FPATCH2.PRG - the patch for the serial port.

Message-ID: <28p7s9INN2jvg@rs1.rrz.Uni-Koeln.DE>
Source record: 36408

Hi again,

I grabbed and compiled the latest mintlibs this weekend, compiled them, and compiled the file utils with them. This finally gave me a fully working ls. Thanx to all who replied. The minix filesystem proved to work ok, I used it for the compiling all the time -- I just couldn't ls properly until I finally got the fileutils to compile.
Amon the fileutils, I couldn't get touch to compile -- gcc-ld cannot resolve the symbol _timezone. Has anyone come across this before, and solved it?
In the process of making and compiling stuff, I had to get a few utilities used by the makefiles (sh, bison, sed), thanx to all who did the ports. One little thing about these, could we agree on the extension ".st" for Atari-specific docs and makefiles? Some archives used ".tos" instead, and this confuses TOS when I try to view them by double clicking.

My understanding is that the MiNT kernel itself or one of its filesystems allocate some memory from the system's free pool, which may result in fragmenting the pool. However, there may be bugs as well.

4957. Atari Spectre GCR Mac Emulator, printer drivers

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-04 15:09:40 UTC
From: T.I.Morley@lut.ac.uk
Message-ID: <CEDos4.F9v@lut.ac.uk>
Source record: 36411

Does anyone know of a decent Epson compatible printer driver which will work with Spectre v3.0? I recently purchased PowerPrint from GST Softworks, after being told by their sales team that it would work with Spectre.
I have since found that this is not the case, as whatever application I try to print from, and whichever printer driver I select, I get the message: "System error, stack collision with heap!". This happens with a newly partitioned hard disk, no inits/cdevs and a minimal newly installed system/finder, so I know it's not a heap/desktop problem. GST have now admitted that they know of other users having the same problems and have advised me to go back to their previous product 'JetLink' as this is known to work with Spectre.

All I really want is a driver which will work reliably with Spectre and an Epson compatible Printer (actually the Canon BJ10-sx in Epson LQ510 mode), and preferably the driver will work with
the Adobe Font manager ATM.
Can anyone help?

I got the same problem with a colour monitor from Thomson a while ago.
The best solution I found: I soldered two wires that by-passed the switcher:
Now the switcher is always on :-) and I've put an external switcher. It works
for me since 1991.

> was not compiled with -mbaserel ... ?

Doesn't the linker complain if you link in a non -mbaserel library? Or
is that only if the functions in the library are large enough? I know
the latest port of gnu-ld complained when I tried to link the portable
math library with some -mbaserel code I'd built.

Anyone care to make pml -mbaserel compatible? It's not just a simple
re-compile... :-(Prevented me from making a really nice port of
PBM-Plus that used _four_ executables and hard links on a minix
partition... dang!

My ACCs can run in low-res.

My hard drive is an old Astra HD+ (20 meg).
The hard drive software is ASTRA103.PRG and is booted from the A drive.

> The hard drive software is ASTRA103.PRG and is booted from the A drive.

Usually, when the resolution is changed, the ACCs are removed so that a reboot (which should reload them) will run the ACCs again, since they detect resolution at start-up. After selecting low-res, you may have to warm-boot the system to get your ACCs back. Or, create a boot floppy with the ACCs you intend to use, and try to Save Desktop in Low-res.

It might also be the case that once your computer detects the hard-drive after a cold-boot, it attempts to use the hard-drive during a warm-boot or res-change. (see if your Set Preferences... Confirm Delete changes with a res-change)

JH>if I'm wrong, no doubt. :)

You are.
First, the original poster only wanted to use the drive as a 720K drive, and
that's no problem at all.
Second, my 1040ST works fine with a 3.5" and a 5.25" HD disk drive. All you
need is the drive, the new Floppy Controller from Atari (called AJAX) -
sometimes the old one works, too. And a little circuit that supplies 16MHz
instead of 8MHz to the FDC when there is a HD floppy in the drive. I think
there should be docs about that somewhere - maybe a.a.u.e?

When I examined the latest AdSCSI board, I noticed that although the data lines
are buffered, the parity line is not - THOUGH IT IS CONNECTED.

My guess is that it does not have enough current to handle all drives,
or for some multiple drive systems.

My Ricoh has parity permanently enabled (thanks to Ricoh themselves
for replying), but after I upgraded to the latest AdSCSI it worked fine.

Hi,

There's been a bit of discussion about 68881/2 FPU's for the atari range here recently - but I'm still a little unsure.

Which chip will work with a _MEGA STe_ ? Also, a) is it worth it (ie what software will it improve etc.) and b) what sort of cost would it be ?(UK supplier prefered)

Thanks in advance,

Martin

P.S. To save bandwidth - email me and I'll sumarize if necessary. Ta :-)

I often use HD disks in 1.44 PC drives, formatted to 720K (yes, you need a piece of tape to cover the other hole) to bring ST software home from the net. If the HD disk is formatted with a 1.44 meg floppy drive, this should work fine... at least I haven't had a problem.

Obviously that seems to be the case. I'm no longer sure if I'd like to call
this a "bug" or a "feature", but in my eyes this should be subject of
improovement. The newest (non-public) versions of MiNT seem to be a bit
more relaxed on this, or so I was told...

>is about 1 inch square, has all the pins underneath
>(I think a PGA type) and is rated at 50MHz.
>I think!

The Falcon030 needs a PLCC type FPU (i.e. pins on the side all around the
black plastic square, like the old ST's mmu and glue chip). PGA won't
work. Btw.: in the Falcon030 the FPU is placed under the power-supply.
With the speed I have no experience, the Falcon030 FPU is driven with
a 16Mhz clock, maybe that's too slow for a 50Mhz version (I don't know...)

Is this a joke?
There is no way to do a smooth game using VDI-calls, unless you only need
VERY few, VERY small sprites. All good games on the ST have there own
spritehandling routines, written in 100% assembly languge!

I think the speed is not a big concern, because you can probably
easily change the clock for the FPU so that it runs at 32 or 50Mhz
even though the main CPU still runs at 16Mhz !

For sale, Microvitec CUB COLOUR MONITOR.

I can supply the relevant cable to attach it to any Atari,
Commodore, PC etc etc. Will connect to most computers. RGB
analogue or TTL. Good picture, I use one myself and
I've got one spare.

If you want to use it with CUBASE or similar high resolution
software, I can supply a Public Domain mono emulator accessory
that gives you a very useable picture on a colour monitor.

If you play a lot of games, a monitor like this could
definately help improve the health of your poor eyes...

Delivery within a reasonable radius of Peckham or Ladbroke Grove
can be arranged free of charge.

50 pounds, including cable and
delivery, or nearest offer.

Now you can't say fairer than that, can you.

Leave a message on 081-693-2846 and Ill get back to you
as soon as possible.....

Source record: 36344

Moi All,

Everybody who runs Multitos and wants to load accesories after booting.
Just add this to your NEWDESK.INF (at the same place as your other program
extensions defenitions: prg/ttp/gtp etc.) #A 03 04 000 *.ACC@ @ @
#A 03 04 000 *.ACX@ @ @
You should be able to start accesories with the extension ACC & ACX from
your Multitos desktop with this, however if your save your DESKTOP in
another, older TOS version you will lose this again. So beware!! (-|

Good luck,

+-+-+-

Check your monitor cable, plug and the socket on your computer. A loose
connection can cause this type of problem. It also could be something
more serious though :-(

> ones) seem to have worked... now the questions are...

I have a copy of the TT Service Manual, which actually has schematics for the entire TT, including the TT and ST RAM expansion boards. It seems that there are in fact 2 types of Atari made TT RAM boards - one with 3 jumpers (w1,w2,w3) and one with 6 jumpers (w101-w106). It also seems to be impossible to upgrade the 3-jumper boards to 16MB as according to the circuit diag. only the SIMM address lines A0-A9 are connected to the TT RAM controller chip. The jumpers on the 3 jumper board just enable/disable burst-mode and change the starting address of the TT RAM.

However the 6 jumper boards are upgradeable, and the jumper settings are:

w101 w102 w106
1 Meg x 8 SIMMs (4MB) 2-3 2-3 2-3
4 Meg x 8 SIMMs (16MB) 1-2 1-2 1-2

Jumpers w103 and 104 alter the start address of the TT RAM and the default setting is 2-3 for both jumpers.

Jumper w105 enables or disables burst-mode:
1-2 Burst-mode OFF , 2-3 Burst-mode ON (default setting).

TT RAM can be made up from either 8 or 9 bit wide SIMMs , as the TT doesn't use the parity bit. I am not sure how fast the SIMMs should be - I have a GE-Soft 32MB TT RAM board and I've filled it with 8 1 Meg x 9 70ns SIMMs, but I guess that 60,70 or 80ns SIMMs would probably work as well, but it might be wise not to mix speeds.

Hope I have helped,
Cheers,
Joe Tapply.

P.S. It is nice to know that I'm not the only TT owner in the world!

I run a HD on my TOS 1.0 STf, so I can tell you all about it!

TOS 1.0 limits partition size to 16 MB (not really a big problem
unless you have a lot of HD space!). You can get around this by
making "BGM" partitions with ICD's format utility... I don't
reccommend that, though, since BGM makes bigger sectors (If I remember
correctly) and since all files must take up at least one sector, you
can actually LOSE space by making these big partitions! I reccommend
getting a relatively small HD (I use a 50-megger) and using 16 Meg
partitions.

Second, TOS 1.0 has LOTS of trouble dealing with big FATs... Once you
get some files on your HD, it starts slooooowwwwwwing dowwwwwwwnnnnnn
a LOT (like 30 seconds for a file write!). You can fix this with an
auto-boot program, though. Get either FATSPEED.PRG or TURBODOS.PRG.
I prefer TURBODOS since it seems a LOT faster to me, but FATSPEED
works too.

So it IS possible to run an ST with a HD under TOS 1.0 (despite what
many on here would like you to believe), but it involves some
compromises. Get a HD, get TURBODOS, use them, and get 1.4 when you
can afford to...

Please can someone refresh my memory about the pitfalls to do with adding a Hard Drive to a TOS 1.0 system. I seem to remember that partition size is a limiting factor and accessibility of data is not as fast as in later versions of TOS.

Yes I know I should get at least TOS 1.4 or higher but I don't want to loose compatibility with 7/8 year old software. I believe you can now get ROM switchy boards but I don't think my ancient 1040ST (one of the first to be delivered with TOS in ROM) will take kindly to such 'surgery'!

Thanks in advance

I wonder if anyone can help with this. I am trying to get the <ALT> key to work as the META key in GNU Emacs. Version 18.55 works OK on my UK keyboard but every version above it fails to recognise the <ALT> key: except that <ALT>-x is fine anything else just sets the mark.

Also is there a version of Emacs that redirects the std files before spawning another process. None of the futil programs like ls etc do this in their initialisation code (it appears that parseargs has had redirection removed!). So I am having difficulty using 'dired' in emacs.

You'll have to turn RTS/CTS handshake on in CoNnects port setup, in your modem's setup (AT &K3 for SUPRAs) and make sure your cable has all nine wires connected.

bye, Peter

4993. Some help with comms and vro_cpyfm

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-06 22:06:24 UTC
From: Graham.Leggett@f71.n7107.z5.fidonet.org
Message-ID: <2115.2CB289C3@catpe.alt.za>
Source record: 36342

Greetings all.

I'm currently writing a terminal program, and currently have 2 small problems... I'm using a 1040STFM (TOS 1.2), and am coding in m/c using devpac 2...

The first problem is with the VDI function vro_cpyfm to blit screens from A to B. I'm trying to implement a pull down menu, exactly like the one in GEM, and am using the function to save the background into an internal buffer, and restoring it again when done.

Problem - the internal buffer is ignored, and the block behind the menu is saved to the main screen - in the current clipping (from a previous window redraw). If I turn clipping off, the top of the screen becomes corrupted rather badly, the internal buffer I painstakingly set up is still ignored.

The source and destination addresses are set up correctly, the sizes are right. This function has also failed sporadically in window scrolls and other such things... anyone have a clue what the problem is? What is the politically correct way of using vro_cpyfm?

Second question: Can anyone tell me where I can obtain/ftp some sort of reference on how to use COM ports on the TT and Falcon? I have info in the ST, but that's all changed in the new machines. If anyone can help, I'd be extrememly grateful.

If possible please respond to 007lga3@witsvma.wits.ac.za, as I can't always read this newsgroup.

Thanks.
Graham Leggett

TT-ram uses nibble-mode SIMMS; these are _not_ standard SIMMS, and cost substantially more. This is the difference between TT- and ST-ram.

Sorry to disappoint you guys, but atari skimped on me, and I didn't get CONFIG.PRG. Shit they even left out Atari Works, and I >may< get that from them in the post ....

Karl.

BTW my computer is now fine thanx!

A friendly user named Paul told me that if you put TOS 2.06 chips into a 1040STE (or whatnot), you have to set some jumpers. Anyone know anything about this?

Thanks,
Matt Koundakjian (eaeg254@orion.oac.uci.edu)

4998. Everyone loves a (gdb) puzzle.

Newsgroup: comp.sys.atari.st.tech

Hi,

I'll start with the question that is most likely to get an answer:

1.)

I tried compiling the source for Andreas Schwab's port of gdb 3.6 PL 3. Compilation succeeds with a couple of disconcerting warning messages, but the killer is that the linker chokes because of the undefined symbols "setpgid" and "__fixsfdi". Neither of these is in the mint libraries, so where do I get them? Is an executable of this version of gdb available anywhere on the net (I checked ftp.germany.eu.net--could only find source)?

2.)

The reason I am trying to compile PL 3 is that the gdb 3.6 PL 2 that I have been using for some time (without incident) has suddenly ceased to work. It behaves normally except that it refuses to stop at most of the breakpoints that I set. It will still stop at some (apparently randomly), but it just flies by most.

Typing "info break" lists all the breakpoints and gives their status as "enabled", but when the program runs, they are generally ignored.

I first noticed this behavior after I modified my system temporarily (to test a ghostscript bug) to run mint from the auto folder and load toswin as an accessory. Normally I run mint from a shell when I need it. After I changed back to my normal configuration, I started having this problem.

To make sure I was really back to my normal configuration, ran a configuration script I wrote that sets everything up. The gdb problem remained.

I thought that something had become corrupted, so I removed from my hard disk all files having to do with gcc and gdb (executables, includes, libs, ... everything) and then I restored them from the original zoo archives. The problem persists.

Does anyone have any idea at all what could be causing this?

Thanks,

-Tim Gallivan

Replying to myself? I must lead a dull life ....

Anyway, you should be careful of Fractal compressors. The fractal compressors that are around at the moment are lossy, that is, they lose bits of data during the compression/decompression phases. This is because they are actually trying to do a representation of the file using a fractal formulae, i.e. they approximate the file using a fraction, etc.

Thus, they are really only good for images.

Regards,

Karl.

Please forget PL3, it was incomplete and didn't work. I have just uploaded PL4 to ftp.germany.eu.net, it should soon be available in pub/comp/atari-st/mint, sources in gdb36p4s.zoo, binaries in gdb36p4b.zoo. Please try this. If it's not yet installed, you can find it in the incoming directory.

Andreas.

>Please can someone refresh my memory about the pitfalls to do with
>adding a Hard Drive to a TOS 1.0 system. I seem to remember that

I think the promblem is that TOS 1.0 is slooooooooooow with harddisks.
In addition I think I remember some problems with 1.0 trashing FAT's
(both on floppy disks and on harddisks.)

>Yes I know I should get at least TOS 1.4 or higher but I don't want to
>loose compatibility with 7/8 year old software. I believe you can now

TOS 1.4 is very compatible (more than in TOS 1.2). I had VERY few
problems with programs not working with 1.4. On TOS 2.06 however
they have used a TIMER earlier unused in the OS keyboard routine, and
this causes total crashes on very many games (I have a patch, but...)

5006. Problem with 4Meg upgrade for 1040STFM

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-07 11:02:02 UTC
From: tkld@cogsci.ed.ac.uk
Message-ID: <TKLD.93Oct7120202@scott.cogsci.ed.ac.uk>
Source record: 36357

I have this problem with a 4 meg upgrade for my 1040stfm (Type I motherboard, Rev D)

It's basically the Frontier/Marpet plug in one with an ordinary RAM board, rather than SIMMs.

However much I check and recheck the MMU and shifter adapters, the ram check porgram informs me I have 1Mb of RAM, and would I like to test it.

The instructions mention jump leads to disable the on-board RAM, which did not come with my upgrade. The suppliers assured me I don't need them and I should ignore that section of the instructions. Is this my problem ? I'm having great difficulty getting through to them on the phone (can you believe a number is engaged *all day* ?) and my ST is in pieces on the desk.

I guess the other thing could be the board only has 1Mb on it. It has 32 chips (from a variety of manufacturers) with no recognisable size marked on them. They should each be 1Kbit, right ?

If it's just the jump leads, I'm not afraid of using a soldering iron (but would like recommendations for a suitable UK model - I'm in the market for a new one)

Maybe I'm unique, but I have a TOS 1.0 1040ST and a 110MB HD and I don't see what the problem is. OK, so TOS 1.0 is slow at opening/creating a file (NOT reading/writing to it) but I use the FATSPEED program and I can't tell the difference now between that and running it on a friends Mega2 with TOS 1.4.

I've thought about upgrading but I don't see TOS 1.4 advertised anywhere (in the UK mags) and I'm not about to hack up my ST any more that it already is to add TOS 2.06 (plus I don't think the board is compatible with my SIMM upgrade - and my ST's power supply runs *hot* as it is).

I say check out FATSPEED before spending any money...

>on them. They should each be 1Kbit, right ?

O.K. I'm not a great expert. But here's what I know!!

I bought the Marpet board when it was still the frontier one and installed it myself to upgrade to 4 Megs like Yourself. I definatly put the jump leads in to disconnect the select lines to the RAM chips. I believe this must be done otherwise the computer will still only see two 1/2 Meg memory banks rather than the two 2 Meg memory banks you have just put in when it is resizing the memory at boot up. At the very least it will be driving two sets of memory at the same time if you do not, Not what the ST was

desiged to do!!!

My suggestion Screw the Supplier and put the jump leads in. Frontier new what they were doing when they wrote the manual and it sounds like your supplier knows sweet F.A. and are just saving face not admitting that they sold you an incomplete upgrade.

The boards should be four 1 megabyte simms. The chips would have some number on them something like ???1024??? saying that each chip has 1024 Kbits on it. Eight on each board making 1024 Kbytes (1 Meg) and four boards (4 Megs)

Anyway thats my rather more than 2 peneth worth.

Sounds highly apochryphal to me. Someone may have written something about the idea; it is certainly a neat idea. Unfortunately, it's an idea that is likely to have little to do with reality.

If Atari were, like, QUICK at coming out with something with a PowerPC chip, then they could probably accomplish some new market share. But seeing as how they'd start with ZERO software base (making it emulate an ST would be a lot of fiddly work, witness Mihocka's GEMulator...), and the fact that OS issues would be very important, I'm really not sure that they're up to it.

I'm not sure of just what sort of level of innovation they'll be able to provide. They're not particularly an OS producer; while MultiTOS may be what DOS wishes it could be, it's not particularly innovative. There's no sin in that; I'm happy to be able to use such stuff; it's just that Atari needs something more than that.

If they could sell a 16MB PowerPC system running XWindows and perhaps grab a Mach kernel, and bundle an operational system with 200MB of HD space, I'm sure they'd sell a good number of them, at least in the "hacking" community.

I'm not sure what other value there would be to moving to the PowerPC.

I am currently banging away on a Mega STe keyboard connected to a 1040 STf. No hacking required on the mother board. All you have to do is match up the proper pins on the keyboard's connector to the keyboard "posts" on the ST motherboard. I simply bought a Mega Mater from Toad computer to accomplish this rather than trying to cook up a home job.

Whether or not this all applies to an STe I don't know.

The Mega STe keyboard is very nice. I understand it is based on the TT keyboard? Very comfy. Beats the hell out of using the one built into the 1040. Carpal Tunnel Syndrome anyone?

BTW, I just bought the keyboard yesterday (how timely!). I don't know much about the hardware aspect of the entire system so forgive if this is a stupid question: is the mouse control part of the keyboard system? I ask this because my mouse moves noticably different (faster even) with the Mega STe keyboard than the 1040 internal one (this is addressed to the newsgroup at large).

5016. A few programming problems...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-08 05:25:49 UTC
From: dud@stein1.u.washington.edu
Message-ID: <292tkt$gfp@news.u.washington.edu>
Source record: 36369

My friend Jeff Beeghly has a few more questions he asked me to post here for him. You can reply to me and I'll forward them to him...

Dan Aylward
dud@u.washington.edu

BOXTEXT fill pattern.

I have a certain situation where I want to change the fill pattern of a BOXTEXT and FBOXTEXT resource object within a program I am creating (e.g. change the fill from 0 (no fill) to 2 (semi-shaded and back)). I know how to retrieve and set the text of the BOXTEXT object (e.g. ((TEDINFO *)tree_addr[OBJNUMBER].ob_spec)->te_ptext;) and I though that I would use a similar approach in trying to access the fill pattern (e.g. use te_ptmplt), but I'm not having any success. Any suggestions?

Using Bitmap Image data for VRO_COPY

I'm currently writing a program where I am moving the data of a bitmap image around the screen. The image is originally created in a resource editor, then in the resource editor (either ORCS or Interface), I save the image as an *.ICN ascii text file. I then go into my C program, import the ICN file, then do a bunch of editing. The Image data is stored as INT (or SHORT if you're using GNU C), but vro_copy uses long ints, so I end going though the file and change 0x0000, 0x0000, 0x0000,0x0000 to 0x00000000, 0x00000000 (not much fun). So I was wondering, is there any way to convert the data of an image into a long array, so the new array can be used for the vro_copy data?

At this point, you may be asking yourself why don't I just change the objects .ob_x and .ob_y values to the position where I want to display the image, then use a objc_draw(). Well, the problem is that this particular image is going to be used for a bit of animation (NO, NOT A VIDEO GAME!!!), and when I do a objc_draw, the image flickers.....

Also, I have a particular problem with the standard Atari file open/save dialog. After the user has selected a file and presses the OK button, I have a progress indicator/status bar dialog come up.

Normally in the past I haven't used a status bar dialog. Instead I just loaded the file and let the evnt_multi() function parse out all of the redraw messages. Well, in this particular case, I need to refresh the screen BEFORE I get the evnt_multi() loop. Well I tried placing a do_redraw() function (NOTE: do_redraw is such a standard way of redrawing the screen, I won't go into it here) after the file dialog

goes away (and right before I load in my data), my program chokes and crashes. I've narrowed the crash down to the rc_intersect() function.

I was able to hack my program so that it did re-draw the screen, but I have to do a:

evnt_mesag()
do_redraw()

for every window I have open (hence if 4 windows are open, I need to do this method 4 times), but this only works if a portion of the window was "dirtied" by the file open/save dialog. If I have 4 windows open, and only three of the windows were infected by the file dialog, then the program waits until another message happens (like moving one of the windows).

So what I then do is a form_dial(FMD_FINISH, fullx, fully, fullw, fullh), where fullx, fully, fullw, fullh are the dimensions of the entire screen. The only problem with this is that it is UGGGLYYY. The entire screen is re-drawn, and it takes too long to draw each of the windows, then bring up the status bar.

I tried looking at other commercial programs that bring up a status bar and none of them re-painted the screen before they brought up their boxes.

So, my question then is, is this even possible? If so how?

Note: If I use the Universal Item Selector, all is well. It repaints the screen behind it, but I would like to make my program as universal as possible....

Thanks in advance,

Jeff

5017. Re: Turning a Falcon into a to

CONFIG.PRG - Another bloody program that I didn't get with my Falcon 4/63!

That and S.A.M. and audio fun machine!

Better write to Alistair Bodin *AGAIN*!

-Andrew

I was wondering - does anyone out there know if it would be OK to put
all of the extra programs (like AFM, SAM, and this CONFIG thing) up on
an ftp site like a.a.u.e? I myself didn't get CONFIG, and I
understand some people didn't get other programs... I'd be happy to
compress and upload the "FALCON extras" disk that came with my Falcon.

Also, are the talking clock and appointment manager PD or what? They
came with the Falcon as well, but they could be part of the Atariworks
package I guess.

5018. Falcon problem with E+F partitions

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-08 07:29:56 UTC
From: yammouni@vaxc.cc.monash.edu.au
Message-ID: <1993Oct8.172956.92794@vaxc.cc.monash.edu.au>
Source record: 36285

Hello All,
A friend of mine recently purchased a Falcon 4/85 with TOS 4.04. The drive was already formatted and partitioned and everything was working fine up until recently. He is now noticing that partitions E + F are not opening as quickly as the C + D partitions (sometimes even taking up to 20 seconds to open!). Has anyone had this problem? I understand that there may be a patch somewhere which might fix this up but I don't know where it is. Any help on this would be greatly appreciated.

Regards
David Yammouni

Don't dream too much : Bob Brodie did only say that 'They were of course considering the fact of making future Ataris with the PowerPC chip' (not the exact terms). Which means : if the Jaguar sells enough to make money to help advertising for the Falcon, which sells enough to allow the production of greater models.....

But it's a beautiful dream.

> on them. They should each be 1Kbit, right ?

I had a similar problem when installing a 2.5MB Frontier XtraRAM board into my 1040 STFM. The memory test program said '1MB installed'. I called Frontier (as they were then) and they were extraordinarily helpful.

With the 2.5MB upgrade, you disable the ST's upper 0.5MB of memory -- that's where the 2MB on the Frontier board goes. This theoretically gives you 0.5MB in the lower bank, and 2MB in the upper bank.

My ST said, like yours, that it had 1MB of memory. The man at Frontier explained that some STs have an MMU that is incapable of handling uneven memory banks. If you have 0.5MB in the lower bank, it thinks you have 0.5MB in the upper bank as well.
The solution in my case was to disable the lower 0.5MB of memory (using the jump leads), and rewire the MMU adapter so that the Frontier board appeared in the upper memory bank. This leads to a 2MB ST, so you "lose" 0.5MB, but I figured 2MB was still better than 1MB :-)

> If it's just the jump leads, I'm not afraid of using a soldering iron (but
> would like recommendations for a suitable UK model - I'm in the market for
> a new one)

Sounds like you'll need that soldering iron... I've used an Antex iron for years -- it's cheap, and it does a good job (Maplin electronic supplies or any electronic supply shop will have them).

5021. MiNT Maccel3 not compatible (re: MiNT & MIDI problems)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-08 10:21:02 UTC
From: djs@jet.uk
Message-ID: <1993Oct8.102102.11273@jet.uk>
Source record: 36375

A few weeks ago, I posted questions about not being able to access the MIDI ports using Bconstat/Bconin when running MiNT. I thought I had gone through the routine of disabling the AUTO progs until it worked, but when retrying to sort things out last night, I found that it is Atari's MACCEL3 (v3.3) that causes the problem.

With maccel3 and MiNT 1.04 or 1.08, Bconstat(3) produces:
> PID 18 (BTEST) stack underflow
> PID 18 (BTEST) BUS ERROR: User PC=0 (base page=blah)
> PID 18 (BTEST) rm-q: Unable to remove process from queue
> Fatal MiNT error: Adjust debug level and hit a key...

Is there a MiNT compatible mouse accelerator?

I have repaired a couple of atari sm124s and I have found that their
worst enemy was the heat they generated during operation,your problem
also sounds to be heat related,it would be most likly in the video amp
or output section to isolate the problem get yourself some cold spray
I.E. chemtronics freez-it at a local electronics store then remove the
screws from the monitor case but leave the case on and turn on the monitor
and let it run untill it acts up remove the cover and spray one part at
a time untill the picture corrects it self and you will have found the
offending part,be carefull of the High Voltage lead going into the crt
and don't spray the cold spray on any part of the hot crt.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello all,

does anyone know if there is some kind of program available to connect a PC and an Atari ST using the serial or better and faster the parallell port.
The problem i have is that i want to use my PC's tapestation to backup my Atari's harddisk.
I am also planning to use this for filetransfers in both directions. In this case it would be possible to use Z-modem or such a protocol but in the case that i want to transfer a large amount of files located in several subdirectories it requires a lot of work. So i think that the easiest way would be to mount the servers disks on the client.

It would be great if there was a program like the INTERLINK in MS-DOS 6.0, where you mount all disks available on the "server" to the client.

Does anyone know if there is such a kit available for downloadaing with FTP, or is someone planning to make something like this. If not i think its about time to do so.
I am also interested in what commersial products that's available.

Waiting for reply in this news-group or by e-mail,

5025. SM1224 monitor help needed

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-08 16:15:00 UTC
From: truesdale@wheaton.edu
Message-ID: <8OCT199311153782@wheaton.edu>
Source record: 36381

I just got a used color monitor, which seemed to work fine the first time I powered it up. However, the second time I turned it on, its display was shifted over an inch or so to the right. The Horizontal Position trimmer resistor appeared to be bent down, preventing me from turning it.

When I opened the case, I discovered that this trimmer had a cracked lead, so I'm hoping this is the cause of the shifted display.

I can do OK with a soldering iron, and since the component is fairly accessible, I'll try replacing it. However, I can't read the value marking on the edge of the resistor. My question is:

Does anyone have a schematic of the SM1224 and would be kind enough to look up the value and email it to me? (Its number on the board is R710.)

Any related input would be appreciated also.

Thanks much.

Phil

>Just use VDI and SpeedoGDOS calls, then you need not to know the file format of the fonts!
>bye, Uli

There is a situation where you will want to know the speedo font format and yet still use the VDI to keep to programming guidelines, and that is where you draw a bitmap in memory which you then show in a window. This gives you the benefit of a pseudo-double-buffered display, and also means that when your program recieves window redraw messages it only has to redisplay the bitmap rather than redraw the whole display. The disadvantage is that you have to write your own rendering routines for all the objects drawn, which is OK for lines, boxes, circles etc. but tricker for things like vector fonts, since you have to know the format. Speedo format would be ideal, since it is the standard, but it looks increasingly like I will end up using something like the Hershey fonts for my own program, MolSys, since they are free and the format is well known. Unfortunatly, the Hershey fonts are not very nice looking.

Paul's problem above sounds like just like mine: He would like to know the format of the fonts so that he could do the rendering himself, rather than have the VDI do it for him. Does anyone know if the developer documentation has the file format in it?

I could probably overcome this problem by using the memory.sys GDOS driver, which I understand allows you to use the standard VDI calls to draw to a bitmap in memory, which you can then display. However, I don't know if memory.sys allows abritrary resolutions (not just the current one) and I don't know how to program it anyway. (How do you set the address of the bitmap in memory, for instance?) It also means that the program would only run on a system with GDOS and memory.sys installed, which is probably not that many.

5029. Audio HUMM problem finally solved!!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-08 18:35:33 UTC
From: kendall@flammulated.owlnet.rice.edu
Message-ID: <KENDALL.93Oct8123533@flammulated.owlnet.rice.edu>
Source record: 36380

Remember me? I'm the person who had a problem recording from a stereo
to a Falcon. Well, I've finally found something that worked.

First of all, I'd like to thank the many people that replied. Almost
all of the replies said to build some sort of attenuator... I even got
a number of schematics for such attenuators. Sadly, none of them ever
worked for me - the HUMMM would perhaps geta bit softer or louder, but
not noticably so.

So, you ask, however did you manage to overcome the HUMM? Well, I had
thought all along that it was some kind of grounding problem, and that
turned out to be correct. While browsing through Radio Shack today
for more resistors, my eyes lighted upon...

The GROUND LOOP ISOLATOR

I brought it home, and it worked like a charm (except that one of the
cables it came with had one channel cut off, but by now I have so many
cables that replacement took only seconds. Now I have zero HUMM and I
can happily record Muppet and Eek the Cat quotes.

Oh, incedentally - I don't use the headphone jacks any more - a few
people suggested to me that I should be using the Line Out on my amp,
and this works well.

So, to summarize, here is my current setup:

AMP tape out --> Ground Loop Isolator --> RCA to STereo jack --> Falcon.

Once again, thanks to all who replied!

The problem is that if you have the font format you also have to have
Atari's private keys for the encryption. Alternatively you could get the
outlines as bezier's via the v_get_outline call.

In the juli/august/september issues of the german ST-computer magazine you
can find all the information about programming with SpeedoGDOS. You need
some knowledge of the german language though!!

Good luck,

I think GNU-Tar is what you are after. I do not know if this provides the facilities you require but I have read the docs (not yet used it mind) and it sounds like it was written to be as close to Unix Tar as possible.

If any Tar will have what you need this is likely to be it (maybe :)).

>Iam trying to find a way to fix this keyboard somehow in a nice way.
>thank you

Yes, the Mega ST or Mega STE keyboard is compatible with the STF, STFM or
STE style computers, including the Falcon030.

All you have to do is make an adaptor cable.

bye, Peter

Yes, the mouse is controlled by the keyboard processor. That's why the
mouse connectors are on the keyboard rather than the main case.

bye, Peter

All is input. The situation with regards to parity is very muddy, especially
for those of us who have hostadapters that do not support it. Glad to hear you
got your drive up and running.

(illegible signature) Bo Leuf
- Email: bo.leuf@daggskim.ct.se

I would just like to confirm to all that the Falcon seems to support
both parity diabled and enabled - I have two HD's right now, one has
parity on and the other off. They both work fine...

"None" means that the TT uses the first bootable partition as boot
partition. I.e. if the first bootable partition is a TOS partition, TOS will
be booted, if it is a Unix partition, Unix will be booted.

TurboDOS may not be so buggy as it seems. Many of the problems are inherent in TOS 1.0/1.2 and manifest mostly because one uses the harddisk a lot more :-) FAT-buffering (and caching) is dangerous when fundamental GEMDOS faults cause filesystem corruption, since faults can be 'amplified'.

Well, as somebody else allready stated, there is a jumper to disable the
nybble-mode on the atari RAM-card. Thus, you are able to use both
nybble-mode and non-nybble-mode RAM. I have 16 Mb of non-nybble-mode RAM
installed on my atari-card, and it works great.
It is also possible (but not neccessary) to use 9-bit RAM.

Message-ID: <1993Oct10.163201.26020@ugle.unit.no>
Source record: 36295

Hi.

I have just acquired an APPLECD 150 (it was dead cheap, I just _had_ to buy it :-). It is hooked up to my TT via the SCSI port.

Now, the drive works just perfect when reading HS formatted CD's with the atari metados driver. I then downloaded the program cdplayer.prg on atari.archive in an attempt to play audio CD's. Unfortunately this program does not work with the apple drive (which has a Sony CDU 8002 mechanism inside it).

My first question is then, does anybody know about another cd audio player, or know the whereabouts for a text-file describing the SCSI-commands needed to make a program for playing audio CD's ?

My second question: The metados driver does not work with mint/multitos. I have heard that atari has made an .xfs driver for mint. Is this available via the net ?

Cheers

Erling

Source record: 36297

I have a strange hunch that this is a FAQ (even though it wasn't in the csast faq file), but here goes...

My brother has a 1040STE which he'd like to expand to 2 or 2.5 MB. If he wants to go to 2MB, what types of SIMMs or SIPPs (speed, # of chips, etc) should he use? Additionally, what order should he put them in the computer. (ie, do they go in slots 1 & 3, 1&2, or what). I know that you need SIMMFIX to use 2.5MB, and the same questions apply for 2.5MB operation.

Thanks a lot in advance. Feel free to reply by here or via email. I'll summarize email replies I get...

From: cward@netcom.com
Message-ID: <cwardCEpMrp.Elz@netcom.com>
Source record: 36298

I'm thinking about getting a workstation for home/extra-job use. Is XWindows available for the TT030? If so, are the Motif libraries available also? Does a TT XWindows/Motif require Mint/Multi-TOS (Mint/Genevea) or some other supporting software?

Or should I abandon the Atari line and get a i486DX with Coherent?

Any information will be appreciated.

Thanks!

From: lancer@wpi.WPI.EDU
Message-ID: <29anm2$i96@bigboote.WPI.EDU>
Source record: 36300

I have an ST with a strange problem... I managed to fry a RAM chip simewhere in the upper bank. I just installed a half full Zubair 3D/4Meg in the thing, hoping it would sit in the upper bank... No such luck... It replaced the lower bank and left the upper (bad) bank...

Now I have a 2.5 Meg machine that crashes (bus error) every now and then... Can someone offer any tips on how to get the ST to ignore either the entire onboard RAM or just the upper bank?

I tried unsoldering the power to the RAM at the resistor/Cap. No luck... It seemed to kill the entire ST... Then I cut the addressing resistors from the MMU as the Zubair instructions said for the full 4-meg board. This gave me a no-RAM ST... I was thinking of moving the Zubair board's 2meg/4meg jumper, but I thought this might just make an open circuit in the address lines...

I really just want to forget all about the ST's onboard RAM. I'll be filling the rest of the Zubair board as soon as someone offers some DRAMs and I won't need the ST's onboard RAM after that... I don't really want the chips to be a drain on the ST's power supply either... Can I just cut some resistors or caps and have them disappear?

Is there maybe some sort of RAM-manager software out there?

here's the specifics:

1040STf, rev C board, 32 DRAMs onboard, old MMU.
Zubair Z-RAM 3D/4Meg board (installs in the MMU and Video Shifter) with 16 1MBIT DRAMs.

thanks!

.s.

PS: anyone want to trade 16 1MBIT 80ns DIPP DRAMs for 2 1Megx8 80ns SIMMs?

Source record: 36304

I`ve got small problem with the MicroWire (or the LCM1992).
I havemade a replay routine which uses the LCM1992 tone-
controller to set left and right volume to save time.
It works very fine
mostly .....
Sometimes it drops volume to zero and then comes back a after
a short time .

I'm using the standard way to test if the Microwire is busy
sending (something like this)
(setting both Left and right channel to maximum)

```
move.w #$7ff,$ffff8924.w
move.w #$540+20,$ffff8922.w

.test cmp.w #$7ff,$ffff8924.w
bne.s .test

move.w #$500+20,$ffff8922.w
```

I've tried waiting a rasterline before loading and that also
works well (mostly).

If somebody got an idea I would appreciate that much ..

Thanks in advance

Alistair Bodin & the rest of Atari UK are CR*P. The support they provide is dismal in the extreme. When I attempted to get the correct system software for my Falcon, they said that AFM & SAM were not finished yet - I'd already got them from a BBS at this point (they were broadcast over FIDONET), and that Speedo was not ready to ship either - even when it was already
shipping on UK Falcons. And the last MultiTOS disc I was sent had a version on the Viewer application which simply didn't work. So I phoned Alistair AGAIN and he just said yeah, we know
that the Viewer doesn't work!!!!! SO WHY DID THEY SEND ME IT!!!! The old Bloody viewer program
worked fine until the new one overwrote it!!!!

XWindows was included in the Atari System V Release 4 Unix for the TT. It is
not available as standalone package because X needs Unix as operating system.
If you simply want to use your TT as X-Terminal you can use the X11R5
compliant X-Server by X/software. First you will have to buy an ethernet
card for your TT, of course, to get the server working.
For further information on ethernet cards and X servers contact X/software
Michael Gehret:

info%xsoft@mail.Germany.EU.net

BTW, you will have to pay more than 1500 DM for an ethernet card and an X
server.

>program recieves window redraw messages it only has to redisplay the bitmap
>rather than redraw the whole display. The disadvantage is that you have to

Okay, but the SpeedoGDOS text already is bitmap cached. That means, first time
the character 'a' of font 'VAG rounded' is drawn, a bitmap of the result is
added to the cache. The next time the character should be displayed, just
the bitmap will be transferred.
To get the bitmap of the character, you have to use the VDI call 'v_get_bitmap'
(don't known the exact name at the moment, but I can look it up).

>in memory, for instance?) It also means that the program would only run on
>a system with GDOS and memory.sys installed, which is probably not that many.

But it would be a great advantage to run with GDOS, both for programmers and
users. By not using GDOS, every programmer has to do double work, which he
could better spend on other things.

bye, Uli

I've written a program that plays samples through the DMA on my STE.
(Well I lied - it's better than that, but thats not important.)
Will it work on a Falcon ?
Will I have to make modifications to my program or set up of a Falcon ?

Cheers, Phil.

You can download Space Junk (demo) from ftp.uni-kl.de if you want, but you
will have to recombine it into 1 zip file before unzipping it.

I don't know what the deal is with atari.archive.umich.edu, but stuff is
building up in the 'New' directory like you wouldn't believe but you can't get
any of it!

5061. Megafile 30 - low level format ?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-11 17:56:15 UTC
From: m89ewe@albireo.tdb.uu.se
Message-ID: <29c6nv$opq@corax.udac.uu.se>
Source record: 36313

I'm having trouble with my Megafile 30 (connected to a 1040STe).
I can format it using HDX but I get a lot of bad sectors (3000-5000).
When I copy files to the harddisk it sometimes work, sometimes totally
corrupts whatever was already on it.

I think it would be a good idea to low level format the HD.

1. Is this possible ?
2. What programs do I need ?
3. Where can I find these programs (on ftp sites) ?
4. Any other suggestions or ideas ?

Replies by email is preferred.

Thanx.

>it might be wise not to mix speeds.

My dealer told me that the TT RAM boards use nibble mode SIMMs. These
are quite a bit more expensive than standard page mode SIMMs. He did
tell me that you can use page mode SIMMs but that you take about a 15%
performance hit. Perhaps the "burst mode" jumper on these boards is
to distinguish whether page mode (burst mode off?) or nibble mode
(burst mode on?) are installed.

5063. GEM Programming with GCC

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-11 21:08:09 UTC
From: bgilbert@cs.washington.edu
Message-ID: <1993Oct11.210809.1296@beaver.cs.washington.edu>
Source record: 36315

Hi all!

Recently I've been trying to compile a few small GEM programs on my Falcon030 with GNU C. The programs do simple things like open a window or two, draw lines on the screen, figure out the current resolution, etc.

Unfortunately the last time I used the programs I was working on a 520ST with TOS 1.0 and Sozobon HSC 1.33. So, I have managed to get the programs to compile with GNU C (the main problem was I had to define the WORD type as a short), but they don't seem to run too well on my Falcon. For example, I have a small function open_vwork which opens a virtual workstation and returns the handle. It ran perfectly fine on my 520ST but on the Falcon the handle always seems to come back 0, indicating that GEM was unable to open a new workstation.

Is this a problem with my program? I've looked it over many times and it all seems correct according to the sample Sozobon files I have and the documentation in the Atari Compendium. I am also running under MultiTOS, could this be a factor?

Any advice would be appreciated (I'd also be interested if anyone had any sample GEM code that works under GNU C on a Falcon so I could compare with what I have).

Regards,

>I would just like to confirm to all that the Falcon seems to support
>both parity diabled and enabled - I have two HD's right now, one has
>parity on and the other off. They both work fine...

Almost right - Falcon030 and TT generate a parity bit.

So why do drives with "parity off" work then?

Because you don't turn off parity _generation_, but parity _checking_.
So a drive with its parity jumper removed will generate a parity bit for
outgoing data, but will not check parity for incoming data.

Result: Works fine from the Falcon/TT's point of view, because it gets
correct parity bits for data coming into it, but your drive won't detect
any errors on data coming from the computer. Better turn parity checking
back on (if you like your data, that is :-)

bye, Peter

5067. Code Management Tools

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-12 05:11:03 UTC
From: jameson@cal.isac.ca
Message-ID: <1993Oct12.051103.15449@cal.isac.ca>
Source record: 36246

I couldn't find comp.os.atari.programmers newsgroup, so I'm posting
this here. I hope that's ok.

Code Management Tools
For Multi-Platform Development Environments

Book Reviewers and Code Porting Volunteers Wanted

This is a request for people who
- will review my book on Code Management Tools
- will help port the included source code to Macs,Ataris,Amigas,etc.

I've ported the code for MSDOS and Unix already, and we have enough
MSDOS and Unix types for reviewers. So this request is for people with
non-Unix, non-MSDOS systems.

If you help out, you get
- some decent code management tools on your computing platform
- a free copy of the final book (and code) from OReilly and Associates
- and your name in the preface of the book.

If you're still interested, please read on.

I've just written a book called "Code Management Tools" for
multi-platform development environments. It covers source code control,
directory structures, automatic generation of complete makefiles, and
practical file sharing (code reuse) techniques. It also discusses design
issues for code management systems.

The book is intended to be a practical, one-stop-shopping product for
multi-platform code management tools. It's about 400 pages long, and
includes source code for about 30 software tools (including a
multi-platform version of RCS), so that pople can port the code to
machines that I haven't got access to.

I've already ported the tools to MSDOS (for Borland C 2.0, Microsoft C
6.0) and to Unix (Sun4 under GCC). The problem is that I don't have
access to Macintoshes, Amigas, Ataris, Next machines, VMS machines, or
any other such machines. So I'll never be able to port the tools to
those platforms. (I don't have the necessary knowledge to port the code
to these machines, either.)

So I'm asking for knowledgeable, serious volunteers to review the book
and port my ANSI C code and batch files to their machines, so that I can
include the ported code with the book. (Many of the tools are batch
files and shell scripts that call freeware tools such as sed, gawk,

find, and fgrep, so porting the tools shouldn't be that hard.)

My hope is that individuals, or small groups of people from various user groups for these various computers, will undertake the job of porting the scripts to their computers. That way, people who own those computers will have access to more software engineering tools on their particular computers.

As you probably know, there are very few---if any---good, low-cost software engineering tools for many of these computing platforms. That's why I wrote this book, and included the source code--to address this need.

I hope you'll help if you can, even if you can only port a few of the tools and scripts. (Porting RCS---which I didn't write---will be the toughest part. Let's say that it's "challenging.")

OReilly and Associates will give you recognition in the preface, and a free copy of the book if you send them your comments in written form. Nothing too fancy is required---but it's got to be a serious report.

What we do want are people who'll help us produce a better book and software product. What we don't want are people who just want a free copy of the draft book.

Please respond to jameson@cal.isac.ca if you are interested.

Thanks
kj

Buy a new drive mechanism. a 30 Mb drive are not that expensive, and will
make your disk 'just' like new.

>
Your problem might be that GCC's int defaults to 32 bit, and the normal GEM
libs are also compiled to take int as parameter, not short. Your can change
this when compiling with the -mshort switch which switches the compiler to
a 16 bit int. But then you must have the gnu16.olb and gem16.olb, which are
compiled with the same settings.

5072. Do you want a 36 MHz Atari ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-12 09:35:32 UTC
From: Christiaan_Kamstra@p1.f503.n285.z2.fidonet
Message-ID: <2cba7dc2@p1.f503.n285.z2.fidonet>
Source record: 36252

Hi everyone!

Note: this is *NOT* an advertisement or something. I bought the thing and it really works great. I want to share my experiences, so you may be able to enjoy it too!

I recently bought a speed-up kit for my ST. Its from a german company called H & N.

There are two kits available:

* HSB 640 28 MHz (about $200)

* HSB 640 38 MHz (about $350)

These are some specs:

* 68HC000 processor
* optional 68881 coprocessor
* 28 or 36 MHz clockfrequency
* 64 KByte cache (data- and instruction cache)
* asynchronous bus-timing
* SMD technology
* Cache can be switched on an off
* Can be switched back to 8 MHz

It really works great! I have not heard of any problems with software yet. (very stable)

Installing is quite a job. The old processor has to be removed and a socket is installed in its place. The board measures about 8 cm by 10 cm. It is placed in the socket. The blitter has to be removed. (you won't notice the speed increase it gives anymore) There are two little sockets on the board on which another board can be fitted (the co-processor board)

You can opt for switches or a software way to switch the speed and the cache. It is also possible to connect a little LED, which indicates the speed.

If you use NVDI with this board it will REALLY knock your socks off!

If you are interested the adress is:

You should *not* use short. The GEM library is configured to
automagically convert 32 bit int's to 16 bit int's and vice-versa. You
can however add -mshort to the compiler flags. This will turn the 32
bit int's into 16 bit int's, and you must use the 16 bit version of
the GEM library (i.e. -lgem16).

|> For example,
|> I have a small function open_vwork which opens a virtual workstation and

Most likely you are passing a short * to v_opnvwk while it expects an
int *, so that the high word is always cleared. But GCC should warn
you that you are passing an incompatible pointer.

Hope this helps.

I suppose you realise that if you do this, you will be re-writing the Speedo-GDOS font rendering engine? I find it difficult to believe that there isn't another way of doing what you want.

How about drawing the text on screen, then using vro_cpyfm() to blit it to your buffer area. As your current plan is to draw it in the buffer and then blit it to the screen, you'll get the same end result.

Or, how about shifting the logical screen base and then drawing the text. Does that work with the VDI? (I haven't tried it myself).

v_getoutline would be fine, and would solve my problems, but the last time
I tried to use it all I got was an address error. It could be because I'm
not setting something up properly beforehand, since my only documentation
on it is the Lattice C 5.5 addendum, and I didn't try too hard because
I thought maybe that call would only work with FSM-GDOS, not Speedo.
I'll have another go at it, but does anyone know where to get documentation
on programming with Speedo? Maybe the new Lattice 5.6 upgrade covers this
stuff in more detail? Or the Compendium I've been hearing about?
Thanks in advance,

I recently started gem programming with gcc too (until now, I always
used GFA basic which is just so much more convenient), and it took me
some hours to figure out that

```
char w_info[] = "some info";
unsigned long ptr;

ptr = (unsigned long) w_info;
wind_set(handle, WF_INFO, (ptr >> 16) & 0xffff, ptr & 0xffff, 0, 0);
```

puts garbage in the info bar, whereas

```
wind_set(handle, WF_INFO, w_info);
```

seems to work perfectly. Is there any info available on the features of
gem.olb, especially the automagical ones?

> kind to MultiTos/MiNT and clean up after myself!
>
A TSR is intended to stay in memory until the system goes down, and hence there
is NO legal way to remove a program that has terminated with Ptermres().
But since MiNT V0.92 there is another method: do whatever you want with your
program (intercepting vectors etc.), but do in the main program a sleep or
pause or something like that, so that your program does NOT terminate; that way
it does not consume much CPU time, but you can still remove it:
set up a signal handler which removes the program from the vector chains (XBRA!)
and terminates. So the memory is freed, and no vector is left dangling around.

Ulrich

You could port the Gemfast lib to Pure C, but from several Heat 'n Serve C users I have heard that Gemfast is buggy when used with MultiTOS and in certain features when used with dialogs in windows. If you fix the bugs in the process of porting the lib to Pure C, I would LOVE to see the fixes...

5081. EVNT_BUTTON/MULTI bug in MTOS

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-12 19:19:05 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <1993Oct12.191905.12338@beaver.cs.washington.edu>
Source record: 36330

I'm doing a program is GFA Basic that uses EVNT_BUTTON to wait for the mouse button to be LIFTED. I use ~EVNT_BUTTON(1,3,0) e.g 1 click, both button mask (3), and wait for a 0 state. I can also use 0 for # of clicks.

When I do this normally, it works fine, but when I run MultiTos on my TT030, the program locks up (doesn't register the LIFTED button) and it just hangs. It seems to do this on my friends Falcon too.

I CANNOT just use a loop like:

```
REPEAT
UNTIL MOUSEK=0
```

because then the mouse button stick sometimes and whatever was underneath the popup menu (that's what I'm programming) accidently gets selected. When I use EVNT_BUTTON, the mouse button doesn't stick, it waits just fine for the button to be let up.

EVNT_MULTI has the same problem. Also, moving into and out of a rectangular area with EVNT_MULTI seems to hang in MTOS as well.

So what the heck do I do? Is this GFA, or is this an MTOS bug? If I use GRAF_MKSTATE, the button sometimes doesn't register, too, so I can't use that either.

Thanks for any help anyone can give me. I can do assembly stuff if needed to solve the problem. If it's GFA, could I call EVNT_MULTI from an M/L routine?

:font rendering engine?
Hey, how difficult can it be? :)

: I find it difficult to believe that there isn't another way
:of doing what you want.
:How about drawing the text on screen, then using vro_cpyfm() to blit it to your
:buffer area. As your current plan is to draw it in the buffer and then blit it to
:the screen, you'll get the same end result.
:
Well, this would probably work, except in certain cases where I will actually
want to render a much bigger area than the screen onto a bitmap (so that the
picture can be exported as an arbitrary-sized IMG file.) Then the user would
see mysterious letters popping up on the screen, and if it were a *really* big
image, the letters would be larger than the screen itself, and this method
would fail. (Pathalogical case I know, but it could happen.)

:Or, how about shifting the logical screen base and then drawing the text. Does that
:work with the VDI? (I haven't tried it myself).
: --
It certainly works on a standard ST (this is what old versions of Molsys do
anyway), but doing this is not compatible with graphics cards or (probably)
MTOS.

It looks like Alex's suggestion of using v_getoutline is the way to go,
so all I need to do is find out how to use it...

>Thanks in advance,

v_getoutline changed its definition between FSM & Speedo, the FSM version
gave you some hard to use stuff which you had to massage into a bezier,
the Speedo call gives you a bezier which you can plot straight. Not
surprisingly these two are incompatible.

LC5.6 includes the new binding, Modern Atari System Software (the book
which is bundled as part of the upgrade) has docs on it, as does SDS's
Atari Compendium.

Firstly, I'm a big Atari fan (got an ST in '85, an STE, a Falcon...).

BUT - for use as an X terminal, you can buy a 386/486 with a monitor & Gfx card which will do 1024*768, then get linux/4.3BSD & X-windows, for less than then cost of JUST THE SOFTWARE to do this on a TT. I really don't see an advantage in using the TT for this, esp. if all you are doing is using it as an X-terminal to a more powerful machine. This would be an expensive waste of a TT.

hello,
I've got one hard disk for atari ST/TT for sale.
It is:
-made by SUPRA
-has a seagate drive (scsi)
-48Mb formatted, no bad sectors at all
-seagate is 2 years old
-has an internal battery-backup clock and a prg that
reads' the curent time into TOS when booted.
-works with 110-120V. or 220-250V. (USA&Europe)
- _FULL of SOFTWARE_
-and SUPRA's & ATARI's driver software
- It has a SCSI interface so you can hook up to 8 or 9
devices on the same interface...such as: cd_rom,
another HD-drive, disk drive, scanner etc...

Im selling for the highest offerer, so here's your chance... !

Message-ID: <1993Oct13.112719.22083@unix.brighton.ac.uk>
Source record: 36339

I recently installed GCC on my Falcon but after finally getting it set up
I ran across several difficulties. Firstly, I have been pampered by HSC
v1.40 for some time and so want to use the GEMfast bindings. Can I compile
the GEMfast source to work ok under GCC and how can I write accs with GCC.

In HSC I just changed the startup code and tested for a flag _accflag to
find out if the program was being run as an acc.

Is there any good docs on gcc (esp. the libs) for the atari.

>the fixes...
well I have fixed a bug in the dialogs when used with blit option :
in the file FRMDIAL.C, each time a dialog starts, the function
frm_start calls frmx_dial(FMD_START, &ctl->littlerect, &ctl->scrnrect);
whereas when the dialog is finished, the function frm_finish
calls frmx_dial(FMD_DIAL, ...) only if the blit buffer hasn't been
allocated. It should called on any case. I have detected it when
using a user-defined desk, because the list of rectangles for the
redrawing was wrong. I don't have MultiTos, so I'm not sure it's
the only bug.

With GCC you don't have to change the startup code, and the flag to
test is _app (with inverted sense).

When running as accessory, the startup code automagically allocates
stack and heap (with the size from _stksize, default if not set is
2K). malloc() will then allocate from this heap.

> gem.olb, especially the automagical ones?
```

most of the info on the gem bindings are in the header files
(aesbind.h, vdibind.h and gemfast.h). beyond that, more info can be
found in the sources.

general rules that apply, when using the gcc gem libs

(1) - s/WORD/int/ (including arrays)
(2) - pass pointers as pointers, NOT as two WORDS
(3) - pass longs (time) as a long, NOT as two WORDS

(for backwards compatibility, some of the bindings
conditionally will let you pass a pointer as two WORDS or
a long as 2 WORDS, but the default bindings pass a pointer
as a pointer and a long as a long (look for #ifdef __OLD_WAY__
in the bindings)).

the main reason for these sets of rules is that gcc unlike
other compiler has to deal with different width ints depending on the
setting of -mshort. to make the interface consistent, and binding
easier to write/maintain (and have one version for both flavors of
ints) it was decided to base the interface on the "natural" interger,
and to accomodate the width differences in the binding functions
(especially when int arrays are passed in or out of the bindings).
this design decision has been the subject of some debate .....

in your particular case above, the compiler did'nt catch the error
because the prototype for wind_set is

```
int wind_set __PROTO((int WindowHandle, int What, ...));
```

because it takes variable # of arguements depending on the value of
the `What' arguement. the reason you are seeing the behavior you are
is due to rule (2) above.

hope that clears up things a bit,

>
>Yes it does, but it is noticeably slower.
>
Does anyone know how to test if your TT has nybble-mode RAM? The
reason I ask is that the place I bought my RAM from assured me that
it was nybble-mode, but my TT seems to be a little slower than it
should be. Thanks.

5100. GEM programming with GCC

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-13 20:45:35 UTC
From: bgilbert@cs.washington.edu
Message-ID: <1993Oct13.204535.2400@beaver.cs.washington.edu>
Source record: 36249

Thanks to everyone who responded to my post about GCC on my Falcon030. The main problem was I was using the wrong types for all the GEM functions -- I though I had to use 16-bit types when the GCC libraries expect ints for these parameters (which are 32-bit by default).

It works beautifully now and I may actually get some programming done! (although GCC is really stressed running under MultiTOS with 4MB of RAM, you have to delete the desktop to compile anything at all!)

I need some help concerning choosing a cli for my STe.
Requirements: Has built in unix commands esp. "cat"
Is not gigantic...:) (no more than a disk big ~720k)
Is not terminally slow! :(
Is not too cryptic to install/run.

Any help from the pro's?? :) Thanks in advance to anyone who replies!! :)

Greetings People,

Long time since I posted a message in here (grin) but I have moved off
to the world of unix and the joys of BSD.

Having said this I am now looking for unix for the TT or Falcon. If such
a beast exists I would love to hear about it. We want to set up several
of the machines here.

Can you tell me ....

o Is it SYSV, if so what Revision? (sysVr4 ? or BSDish)
o Does it have the Inet Sockets ?
o What is the sys size?
o Does it come with sources and bin's ?
o Is there a FTP'able PD version at all ?
o What is supply from Atari like if a commercial version exists?
o Dave, if you are on the Well reading this what version did you
used to use? A sysV from memory.

Thanks in advance

Jon Clarke

I've been using Gemini for a while and I find it great... Not too big (about 150 Kb in memory as I remember) and includes all the features you need and more.

Gulam is good, too: it's main advantage is that it contains Emacs (my favorite text-mode editor).
But he doesn't deal really well with non-US keyboards, and uses Numeric pad as functions keys (on my French keyboard, at least) and I hate that.

Anyway, with any cli, you can choose your editor, even choose MicroEmacs from Free Software Foundation, and that's what I do with Okami.

I tried Master 6.2, too, but I find it good but too big for the features that are included.

All remarks above are given for a use without MultiTOS... I don't use MTOS in most cases cause it is quite slower, and hangs some programms...

Regards
Patrice

Try the Okami Shell. It seems to be the best of the later Shells with
built in commands. If you're running an STe and try gulam, some commands
(notably the mem command) are likely to crash on your version of TOS (it
was written before the STe was released).

Cheers,

I used an XtraRAM DeLuxe upgrade to put 4MB in my 1040STf. (I don't remember the board revision & I'm not posting from home, but I do remember being very relieved that the jumper plugs went onto the MMU and Video Shifter with no fuss). Mine was the SIMMs on a board kit, which I bought populated. It was essential to disable all the on-board RAM (both banks) for the MMU to see the RAM on the upgrade kit (I think?), and on mine this involved cutting 2 resistor leads in the region of the on-board RAM and using jumper leads to connect supply voltage to the resistors, holding the lines high. The supplied jumper leads had crocodile clips on (look, no soldering) which were too large and unreliable for the space involved, so I soldered lines in instead.

The whole thing worked first time, and has given no problems since, so I'd have to say the instructions supplied with the upgrade kit were right.

Now, for drama, the TOS 2.06 upgrade was *much* more impressive ;^)

The problems that occured were very strange...

At first everything seemed to be OK. But it wasn't...
I soon discovered that the fire-button on joystick 0 didn't work.
But there were no problems when the mouse was connected. The joystick
also worked fine in port 1. When I changed to the old keyboard the problem
disappeared.

This wasn't the only problem. The keyboard also acted kind of weird in certain
situations. Like, if I assembled a program in Devpack and then pressed space
to return to the editor, it took 2-3 seconds before the editor acctually appeared.
This happened ONLY with the MEGA-keyboard!

I came to the conclution that the IKBD must be different in the MEGA-keyboard. So
typed in a listing from "Atari ST Internals" which dumps the IKBD OS to the printer.
When I run the program with the old keyboard connected, it worked fine. And I got a nice OS
dump. But with the MEGA-keyboard nothing happened... Nothing at all!

I guess that if I had connected the keyboard in a wrong way wouldn't have
worked at all.

i am typing on just such a setup and have had absolutely no problems with
it. Perhaps you did not have it wired up right ? The STe is in a tower case
with a tape streamer and a hard disk. Only wish Atari had purpose built it
that way <sigh>

5115. TurboASM complete?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-14 18:25:45 UTC
From: DSM130@psuvm.psu.edu
Message-ID: <93287.142545DSM130@psuvm.psu.edu>
Source record: 36271

Does anyone know if it is possible to get the entire TURBOASM.LZH archive fully translated to english? I have the main program, debugger, and docs but in my German version I noticed quite a bit of extras (especially the sources) that had comments in complete GERMAN. Also, anyone know why the origional German version is much shorter in size (the assembler executable) than the English version? Maybe if you send the registration fee you get the whole package translated, if true, when I find out I'll definately send it in. I ask because I really like the level of productivity I am able to achieve with it. Only complain is the slow file access speed when you load sources, save, assemble, etc.? I am using TOS1.0(sign, Falcon soon though) maybe this is causing the slow file stuff?

Sincerely,
dsm130@psuvm.psu.edu
David S. Miller

P.S. Anyone else enjoy TURBOASM as much as I? Would like to know.

Source record: 36268

In the german computer magazin c't (11/93) is an
article about a 32 MHz 68030 Board with cage and
32 bit /32 MHz TOS on board. It is called PAK 68 / 3

(Prozessor Austausch Karte) They have released PAK 68 / 1 and /2
with 68020 some years ago.

They will sell a board and the GALs needed and you have
to put it all together.

The board is to be plugged in an ordinary 68000 DIL socked.

Patches to the different TOS versions will be in the december issue.

(This board works in MacIntosh and maybe Amiga as well)

Sorry, no idea about the price yet.

SysVR4, but Atari no longer sells it.

It exists for the TT but I think it isn`t supported any more. You have to
contact Atari about it. (I`ve been using it for nearly two years no. It`s
not as fast as on todays workstations, of course.)

> o Is it SYSV, if so what Revision? (sysVr4 ? or BSDish)
SYSVR4.0 with X11R4.

> o Does it have the Inet Sockets ?
Yes.

> o Does it come with sources and bin's ?
Only binaries.

> o Is there a FTP'able PD version at all ?
No.

> o What is supply from Atari like if a commercial version exists?
No support anymore.

Such a shame, too; I thought about buying a TT-- until they dropped the Unix support. (more grist for BobR's mill...)

It's not a problem with the Falcon, it's due to the BIG difference between VGA and TV ... to make it simple, you'll have more CPU power left if you make the demos/games RGB/TV only instead of making them VGA compatible.

MO> And more importantly is there something I can do, to avoid this
MO> switching between tv and svga monitor?

It's called "MultiSync"

This seems pretty unlikely. They haven't shown any signs of bringing a
68040 machine to market, and they seem to have enough trouble getting
'030 machines out there.

5127. TOS 2.06 diskdrive NOISE!!!!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-15 03:31:21 UTC
From: hallvart@ifi.uio.no
Message-ID: <1993Oct15.033121.18288@ifi.uio.no>
Source record: 36275

I installed TOS 2.06 in my STE some time ago (I'll never be able to go back to an older TOS ST
again!). It's really great, and it'll be even better when I get hold of a hard disk.
The problem is this: after I installed it, my disk drive (DSDD) makes a LOT more noise!!!
I've heard some say that this always happens when you change the TOS to 2.06 and others say it only
happens with certain machines!

I got hold of a program called 'HD_FDC' which changes the step-rate, and also makes a HIGH DENSITY
format patch in the desktop`s format program. But it's still a bit irritating, to always have this
program on all of my disks (or use a startup disk all the time).

I'm thinking about upgrading to a HD (1.44MB) disk drive, so I can easier exchange software between
my PC friends.. Will installing a HD disk drive make it more quiet? I'm under the impression that TOS
2.06 was made with HD disk drives in mind.
And finally, does anyone have any tips to what disk drive to buy (can I get hold of a standard PC
type disk drive, or does it have to be Atari ST specific?). I've also heard that one need's a new
controller IC ('AJAX' I believe), while others say you don't.
Someone, please clear up the confusion.
Thanks.

Hallvard

5128. Bug in Atari's HD utils ....

Source record: 36277

Hi.

Recently I lost my F: partition on my Falcon's internal 80 HD. Now, while it was easy to fix, it was damned annoying (and a kick in the butt to keep backups...). Recently there was some talk about a bug in the AHDI? software that when you filled up a partition, the computer would write garbage over the first two sectors of the next partition, thus killing the FAT of that partition , and making the drive unreadable. This makes sense to me, as both my F: and E: were getting very tight for space, and the last thing I remeber is extracting some archives ....

Any Ideas?

Karl.

There is work ongoing to port 386bsd to the Mac env. (to look for:
on ftp.germany.eu.net:/pub/comp/i386/NetBSD-current you find some material).
Is anybody considering to try to port this stuff to the TT or Falcon?
This should be not too hard, if you have access to the hardware specs.
One has to put in some things from Minix ST (handling of the shared DMA
problem).

5132. Floppy Drive Boot Problem

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-15 09:00:53 UTC
From: gigxr01@nt.com
Message-ID: <gigxr01-151093090053@ngalm099.gal.nt.com>
Source record: 36278

Greetings

I have a problem that maybe somebody has seen before:

PROBLEM: Atari ST fails to detect A & B Floppy drives on boot up, but they work
if I use DC Floppy Config to enable drives.

SYSTEM: Ataris 520 with Marpet Xtra-ram (4Mbyte installed).
Tos 1.04, Mono monitor, Supra adapter with Seagate 45 Mbtye drive.
Double sided drives A & B (Teac brand)
All installed in tower case.

I first noticed this about two weeks ago, when I tried to read a floppy just after boot up. I got an error message,"Drive not installed" when I double clicked on drive A. After several re-boots, I finally got the ST to see Drive A & it worked perfectly. This got worse, taking longer & longer to see drive A, until finally (last Tuesday) the ST refused to acknowledge drive A completly.

I used the floppy configuration (by the DC people) which showed that drive A & B were not connected. I enabled A & B & was able to read floppies perfectly, until the next reboot, when I lost them again (happens on both cold & warm boots).

As far as I am aware, the ST checks for drive A, then C on boot, now my atari checks A (LED comes on), quickly moves to B (LED on), then boots from C, leaving drive B's LED on.

I have noticed that the ST does not spend as much time checking drive A on boot as it used to, so I disconnected the hard drive & tried booting from floppy only. Now all I get is the desktop with no drives.

Because my setup is non standard, there may be many reasons why this problem is happening (cables,solder joints), however, I would appreciate any pointers so that I can get right to the problem area.

Regards & thanks in advance

Gerry O'Rourke

Paul> -Paul-

I have since solved the problem - I got a soldering iron and tied the
four resistors to +5v as described in my Frontier/Marpet instructions.
Disabling the onboard RAM means I now have a 4Mb STFM.
My supplier (GO Direct) was wrong - hopefully it was just me they
gave incorrect information to.

I too for one have had funny things happen on my Falcon HD.
Things like files being created which are hidden from desktop and
not deleteable unless I manually update the FAT s.
Another problem was a file could be created as having a filename
of E:\AFILE.DAT, this too was not deleteable.
(NOTE E:\ IS PART OF THE 8 CHAR FILENAME AND IS !NOT! THE FILE PATH)

Bye
Paul

Yes, that's right. There was a bug in AHDI which will kill the FAT of the next partition,
if there isn't enough space left. If I remember correctly, it is fixed in the new Version.
But, what archiver did You used to extract the files? There was also a bug in some older
Version of LHARC, which will also destroy the FAT, if there isn't enough space on the
HD-Partition :-(

>Any Ideas?

Yes, there is a bug indeed. As far as I know this is fixed in AHDI 6.061 or
so. This bug definitely doesn't arise with other drivers, e.g. HuSHI and
HDDRIVER.

That's a bug in GEMDOS, not in LHARC. GEMDOS under certain circumstances destroys the FAT when writing to a media that is already full. LHARC shouldn't try to write on full media, of course. But nevertheless it's a GEMDOS bug because GEMDOS should refuse to write anything if there's no space on a device left.

There are serveral PC-card (from 8086 up to 80386sx)

For MEGA ST and MEGA STE theres's AT-Once (a 16 MHz 386sx card)
Have one myself and it really great - and costs 1/4 of a real 386sx

For all STs there's PC-Speed and AT-Speed (standard AT emulator card)

I think the latest version of the HDX utilities (either 5.0 or 6.x)
have fixed the bug - I can't remember off hand the specific version
number.

I was wondering something. Aren't there 2 FATs designated per
partition? If so, maybe it's possible to use the second fat
(which might not have been overwritten) to get access to that partitions
contents. There should be programs around to do this sort of thing...

Anyone?

>Yes, get hold of AHDI 6.06. v6.03 (and maybe others) have this problem.

Where can I get ahdi 6.06? Has it really fixed this bug? I use ahdi 3.00
and have to get another driver, since I got a second hard drive a few days
ago. ahdi 3.00 doesn't work with two drives at one controller.

Urs

The boot sector may be overwritten, too. This means that first you have to
restore the boot sector before you can check if the second FAT is still
valid.
BTW, this won't really help because TOS actually uses the second FAT, not
the first one. If the boot sector and the second FAT are overwritten the
first FAT is gone, too, because it is located in between.

True, but with the PowerPC on the verge of booming, it's more cost effective
to design around that, and include a 68030 emulator... I guess, given the
choice between a 68040 machine and a PowerPC machine, I might have to pick
the PowerPC, even though it would mean a whole new learning curve...

I'm looking for Powerdos at ftp sites, but so far have not found it.
Does anyone know which site and which directory I can find it at?
I'm under the impression that Powerdos is shareware, not commercial,
correct?

Thanks for the help.

I think if you didn't connect the keyboard's SERIAL DATA IN line correctly,
it would still work, but you wouldn't be able to send commands to the
IKBD to activate special features; this could explain both the joystick
and the IKBD OS dump problems...

Hi all!

The ST I have that died would do the following:

I'd turn it on.
Almost immediately, I'd get a red screen bordered by white. Needless to say, Tos never loaded (no bombs, no "ATARI logo")

What I want to know is is there a meaning to the screen color flashed when the computer crashes prior to loading tos, ie, it fails the power on self test (POST)...

I have gotten yellow screens. But, usually, they're red.

Now, just so you know, this is a 1040STFM with a TEC tos 2.06 board and a XTRA Ram upgrade board bringing the system to 2.5 mb. I have a adscsi based hard drive but its being connected made no difference.

Thanks in advance,
Matt Koundakjian (eaeg254@orion.oac.uci.edu)

No AHDI version supports two drives at one controller. So AHDI 6.06 or any
other version of AHDI won't help you.
CBHD by Claus Brod or my HDDRIVER support such drives.

You're right. This is a bug. But it's a bug from GEMDOS, not from AHDI.
AHDI newer than v6.06 or HDDriver newer than 2.6 should fix this bug. And
if I remember correctly, in TOS 4.04 this bug is fixed in GEMDOS.

regards, Jimmy

If you intend to use a tight evnt_multi() loop, e.g. for tracking the
mouse leaving or entering a button rectangle, you'll have to use
wind_update(BEG_MCTRL) before and wind_update(END_MCTRL) after your
evnt_multi() call. If you don't, other programs will cause your little
loop to lock up.

bye, Peter

Check out mupfel in the Gemini distribution (on atari.archive)... It's
very good, though the 'cat' is incredibly slow for things like:

cat part1 part2 part3 part4 > whole

mupfel is a lot like csh, there is online help (type "help"), and the
documentation is quite good.

I don't have any of these..but there are hardware solutions even for the 1040
to use as a PC Emultor next to PC Ditto there is: PC Speed and SuperCharger
those are I tink XT emulator's and then there is AT Speed and ATonce those
I believe are available in both 286 and 386 version...but I don't know of
a sinlg eplace in th USA let alone NC where to get them..they are German
Products as much as I know..

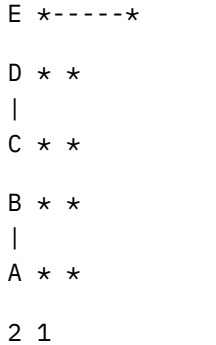
System Solutions sells a "FIRECRACKER" for around $20. Install this and a socket in your 1040STe or ST. I have installed it ina 1040ST, 1040STe and a Mega4ST.
2 of them I used AJAX chips. The 1040STe had a WD1772 (02-02) chip in it. I was able to use this. All my STs have 1.44 meg drives in them. I use TEAC drives; FD235HF-3xxx or FD235HF-4xxx series work. I know the pin setting that you will need. The 40
00 series requires 3 jumpers to be set. The STe has 2 jumper pads internally that need to be unsoldered and moved if you wish to see G`HIGH DENSITY as an option when you select format from the desktop. The MegaSTe just moved pin 7 on the jumper block an
d this feature will be activated.

1;1H2J60414 27-SEP 23:18 General Information
TEAC
From: MICKEYANGELL To: ALL

I talked to TEAC today and they faxed me a spec sheet on the FD235HF4xxx series 1.44 meg drive. I now have the correct settings using 3 jumpers and everything is perfect. I now have 1.44 meg disk drive as my A: drive and 720k as my b: drive. No conflicts. Correct settings are:



A2 to B2 for DRIVE SELECT 0
C2 to D2 for HA Density set automatically.
E2 to E1 for HO HD out on pin 2

The above settings work perfectly with the FIRECRACKER and probably with any other controller.

I hope you like this information.
As you can see I had posted this message on DELPHI. I ope this helps. My 1040STe had a WD1772 (02-02) in it. Try this first.
System Solutions is in West Chicago, Ill. Their number is 708-231-1014
.

Take care.

Uhmm, yes. But only measurable, nothing I would notice myself.
I did some tests with the gem-test program that comes with NVDI, and
compared my old (atari's) 100 ns burst mode simms with my new 80ns
non-burst-mode simms.
Some of the tests where in favor of burst mode, but there were some tests
that actually ran faster with the non-burst-mode simms.

I think I have the printouts from the tests somewhere. If you are very
interested, I could always email them to you...

Dhrystone showed upto ~8000 dhrystones with burstmode, and ~7600 whithout.
That's about 5% slower without burst-mode.

Does anyone know if there is an english *.RSC file for the Trapido telecomm file? Ditto for documentation...

Also, does the MSA file from a.a.u.e. of Trapido have to remaine on floppy after de-MSA'ing it, or can I move it to HD -- MSA told me there was an executable boot-sector in the MSA so I just wondered if it was necessary.

Thanks!

Sounds more like a flakey DMA problem. Especially invalid filenames. I've seen results of bad DMA chips, and this includes trashed partitions, FATS and filename chaos. Generally this seems to be because of the bad DMA "shifting" FAT/filename data by x bytes before a write, which of course makes for totally unpredictable file attributes and mismatched FAT1/FAT2.

However, I've also seen written (as you may have) that some versions of AHDI can be buggy too, like early v6 (6.03 was mentioned).

With luck, and some foresight, and the proper tools, one can sometimes restore partition data (bootsector) and some dir-info when this happens and save (all/most/some) [select appropriate]
of the lost files.

Does anyone know how to use the "! - Escape to shell" option in NetHack 3.1.3
with Gemini/Mupfel on an Atari Mega ST4?

I tried executing NETHACK.TOS from the Mupfel CLI and the "!"'ing in NetHack
but got a message to the effect the C:\Gemini\Mupfel.APP could not be ececuted.

Ideas?

Source record: 36217
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Dear Atarians,

Has anyone used any of the patches (SIMMFIX, 2.5M_STE) so that the STe's can use 2.5 Megs?

I have an STe installed with switchable Tos 1.06/2.06 (Compo).

The problem is that I when I install the extra memory in my 2Mb STe, and have one of the 2 patches that I have come across, it does not work.

From one of them, on booting up, I get the message : 2.5 Meg patch not installed. However, when I take the memory out, it comes up with the message that it has been installed !!!!!

I have not tried using the software with Tos 1.06, but then I don't relly use this OS that often, so there is no point.

Any help ?

Thanks in advance.

Of course it is. I suggest you take a look at HDX or simply use it to format
your drive if you don't believe it.
HDX uses the usual low level SCSI commands to format drives. There is no
lower level.

Yes, I thought so. Nevertheless, in my opinion the system wasn't bad.
Regardless of the fact the todays workstations are of course faster the TT
is not too slow to use System V on it. For me it means that I'm independent
from the machines at the university. And you learn a lot concerning system
adminstration with such a machine at home.

5170. ST's printer port configuration.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-17 19:04:24 UTC
From: dmcdulin@cs.uct.ac.za
Message-ID: <CF22BD.1wn@cs.uct.ac.za>
Source record: 36223

Hello all, it's me again. ;)

I have a wee question to ask all of you hardware gurus out there...

With the Atari ST's printer port, I know that pin 1 is strobe, pins 2 to 9
are the data (1 through 8), and pin 11 is busy.

Now, which pins are ground, and which are +5V ?

I need to steal a power source of +5V from the printer port, and need the
correct pin before I blow something up.

As far as I can make out, pins 18-25 are ground, but I haven't a clue as to
which is +5V. Is there a +5V on the pronter port by any chance? If there isn't
I'll be stealing the joysticks power supply and ground (pins 7 and 8 of the
joystick plug respectively).

Any (and I do mean *ABSOLUTELY* any) help will be appreciated.

On a different line...

I have some info on how to read in from the printer port the following:

To read data from parallel port:
a) set PSG i/o B port to input
b) switch strobe line off
c) check busy line for high, loop till high
d) switch strobe on
e) get data from PSG's B output register.

status register is affected, so code should be in supervisor mode.

And then I also have:

Reading data from a peripheral device onto the bus:

select enable register (mixer register)
set bit 6 to '0' (set I/O port A to input)
select I/O port A data store (I/O port A register)
read data from PSG (read data in I/O port A register)

The register follows signals applied to the port, only by reading will data be
transferred to the bus.

So, can anybody tell me if the following is correct, and if not, what the
problem is... (I'm trying to use register A here...)

In code: (reading data in)

```
move.b #7,$ff8800 (select mixer register)
move.b #0,$ff8802 (enable register A to input)
move.b #14,$ff8800 (select I/O port A)
move.b $ff8802,store (get the value in register A)
```

(At least, that's the way I think it's meant to work...)

I can go and do a trace of BCONIN bios function to see the exact workings of how to use the B register, but I don't want to have to resort to that method just yet...

Again, any help will be appreciated.

Barry

I thought I'd post this for any other Falcon owners who might encounter this problem.

When I first got my Falcon it had a 84MB internal drive (Connor 2.5" IDE) and it was partitioned into 5 more or less equal parts. I repartitioned it with ICD software into 4 parts.

Anyway, I started having strange problems with the drive, such as certain programs would read about 10 times as slow as they should from the hard drive and other programs would occasionally just crash when accessing certain parts of the drive. Also, the ICD driver would report SENSE $11 or SENSE $12 from the drive periodically (my external SCSI drive was fine).

So, I sent my Falcon back to the dealer and what the problem turned out to be was a flaw in the RF shielding on my Falcon. The dealer said a lot of Falcons were coming back with similar problems and that all they had to do was bend the RF-shielding to the proper position and the problem was fixed. I've still got the same original drive in my Falcon although now that it's been fixed I have had absolutely no problems with the internal drive and the slowness is gone. It would seem that since the RF-shielding was formed improperly some sort of interference was messing up the drive or the drive controller or something.

Anyone with similar drive problems (which aren't really related to the partition-full bug since I have used the ICD Pro software all along) might want to talk to their dealer and see if it's the RF-shielding problem. It's definitely much nicer to have a working drive!!

Regards,

5172. ReSOLUTION VGA video card

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-18 07:50:13 UTC
From: domingo@news.delphi.com
Message-ID: <29thrl$sv8@news.delphi.com>
Source record: 36227

Hello world! :-)

I am trying to get some information about the ReSOLUTION VGA video card. My local computer shop wants to sell one to me at a discounted rate. It has never been used, save the time it was plugged into my machine for testing...

What I need to know is what ever happened to the programmers or designers of the system, and what are the cards capabilities.

As far as I could ascertain, it is a programmable SVGA card with Tseng ET-4000 chipset. It can show 16 colors on the screen at a time. There was a planned 256 color VDI driver, but as far as I know it was never written. I was told that there exists a version of NVDI for Tseng ET-4000 video cards. Is this true? And if so, will it work with the ReSOLUTION VGA card?

I am just trying to get better resolution and a few more colors on the cheap.

If anybody has information about the card itself as well as getting it to show more than 16 colors, that would be great.

Thanks!

Dom

P.S. Please reply via e-mail...

Strange. I also play nethack on my Mega ST4, and escaping to Mupfel works
fine. Are you sure you didn't load nethack with the Gemini/Mupfel "overload"
option? This memory-saving feature always deletes Gemini resp. Mupfel from the
memory before loading nethack and reloads it afterwards.

I need a TT-ram board (fast ram) of the NEWER model with 6 "JUMPERS"
(so it can be filled with 4 or 16 Mb simms)

I'm also prepared to exchange or sell a OLDER model TT-ram board with
4mb TT-ram (fast ram / nibble-mode / enables TT's burst mode) if someone
has this newer board with only 2mb of TT-ram or something...

IF SOMEONE KNOWS a place where on can obtain such board (hopefully
unfurnished) -please tell me (e-mail) and if possible send their fax or
e-mail address... (I assume NO-ONE would know the price of such thing ?)

also thrid party memoryboards will be considered if someone has...

And, in fact, no higher level. When DOS users speak of `formatting' they are really referring to `making filesystems' (which fdisk doesn't do automatically, because it's one of the worst programs I've ever seen :-).

As far as I have heard, the distributor doubts it will be ready to be
released before the end of this year.

Also, there is a roumor that there won't be a compiler for GFA 4.0, just a
GFA-to-C converter. (Which I don't really see as a disadvantage, as I think
it would be quite a pain to port things like the MiNTlibs to GFA...)
(Or is that old news anyway?)

5177. POWERDOS HELP !!!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-10-31 20:58:00 UTC
From: christopher.browne@canrem.com
Message-ID: <60.13572.4019.0N188DB3@canrem.com>
Source record: 36231

Applications have to be specially written to multitask under PowerDOS; this isn't a particularly unusual thing for multitasking systems.

The version of PowerDOS that I used to have included a program that would copy files in the background. It did NOT have any program smart enough to allow multitasking of applications in GEM windows, as far as I could tell. At any rate, no such application has been produced to date. Which is why MiNT and Geneva are, at this point, far more viable systems.

Well, if you're using MiNT (I'd suggest you get MiNT 1.09 from
atari.archive) you could get my BSD-Unix-like init package from
Atari.archive and start a getty process on your serial port. This will allow
you to log in and use the remote terminal just as you would under Unix on a
workstation.

You would also be able to use the console at the same time without running
connect.
```

This would not work under plain TOS, however.

I hope this is helpful.

OUTPUT POWER TO THE PEOPLE.

Ready on desk - Ready to produce
LC-HQ In/Out Interface for Atari-ST.
(Non-commercial participation.)

Using the Centronics-port, featuring; "everybody can control it
from any language"

Purposes: * Controlling Analog devices (Including precision applications
such as synthesizer voices).
* Controlling Digital devices (directly, relais etc...).
* Programming RAM (and EPROM when some extra interfacing
is add).
* Running-light controller.
* Robot applications.
* Waveform generation.

On this Euro-board directly available:
---

* Data decoder, adress 0...254
* Demultiprexer for 16 channels.
* 6x 8 Bit High precision (0.027%) Digital to Analog
Converters (DAC's)
* 2 DAC's can be directly joined together to create a
Course & Ultra-fine Pseudo16 Bit DAC.
* 8 Bit logic register. (if DAC registers are used for
logic applications: 7*8=56 logic lines).
* The logic registers also can be set as input (by software
control) to read 8 data lines from the outside world.
* Easy to expand upto max 254 x 8 Bit data lines.
* On board precision reference voltage.
* Low power consumption.
* Fits in 19 Inch Rack ("19 connector lay-out)
* No difficult components (this is no contradiction!)

It's ready On Desk, It's ready for me and it could be ready for you!

Ask: Marc Marc Amsterdam for datails.
Phone +31 20 6259847.
Or E-mail to: benten@hacktic.nl

5184. ATARI Mega Ste Hard disk kit

Hi,

Help ! I just bought a kit from Gasteiner here in the UK to "internalize" the Quantum SCSI drive I've got. It arrived without the "Installation Manual" mentioned in the contents list on the box - not too helpful really.

I rang Gasteiner and was told that that was how they were shipped from Atari - and the technical guy who might be able to help was out for lunch. I rang back the required 40 minutes later, when I was told that Gasteiner were waiting for some manuals from Holland which would be around in 2 weeks so they might be able to help me then ! Aparrently they might send them out to customers but I'm not going to hold my breath after the "friendly, helpful" (not) Gasteiner customer services.

Anyone out there know what I need to do to install this kit - I really don't want to wait "2" weeks before I can do anything. Being an Electronic Engineer I'm sure I can cope - I just need to know what to do.

Any help will be gratefully received.

For a bit more demanding jobs awk and perl are also available - same place.
Awk shows up under names of gawk and mawk (likely).

Writing complicated scripts in sed, branching on conditionals, can
be fun, to an extent, but results are as inscrutable to readers as to
an original writer. :-)

Use AHDI 5.X. It's the fastest, as it doesn't look too much for IDE devices on bootup. We have a Quantum LPS 240 and a Maxtor LXT 340 connected with a Mega ST4 (with 2 ALIAs) and no problems, even not on partitions bigger than 32 MB (the biggest is 58.2 MB) BTW, it's the BBS-Server.

5197. ATARI _DROPS_ THIER COMPUTER LINES!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-01 19:31:36 UTC
From: dlk0ms9s@umiami.ir.miami.edu
Message-ID: <1993Nov1.143136.16219@umiami.ir.miami.edu>
Source record: 36144
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

NOTE: THIS IS NOT A JOKE, FLAME, OR LIE.

Effective immediately, Atari Computer Corporation has ceased
production of ALL of it's computer lines. This includes all TOS,
DOS, and hand-held computers. This information was
released late on Friday., October 29, 1993.

I was given this information by my broker who constantly checks the
Atari news for me.

It also said that there might be a plan in the future to release
compatable computers at an affordable price.

Atari's only priducts for sale will be what is in the stockhouses,
the LYNX, and the upcoming Jaguar.

-time to start looking at those clones.

-Mark Santora

5198. awk/Perl

Newsgroup: comp.sys.atari.st.tech

From: christopher.browne@canrem.com
Message-ID: <60.13583.4019.0N188F68@canrem.com>
Source record: 36147

Certainly awk and Perl are friendlier ways of doing the changes; Perl contains sed commands as a proper subset, which is really quite a nice thing.

I mentioned sed in that it qualifies as probably the smallest tool for doing the job, and in that it is more like grep than the others, which really are computer languages. sed is not really intended to be much of a language. Its ambitions lie in being small and fast.

THE INFORMATION POSTED ABOVE *IS NOT* TRUE. I just called Atari and they
insisted that this RUMOR was FALSE.

Furthermore, if the RUMOR was true, I assure you that we would be hearing it
from more than one 'broker'.

Err no you don't need to be XHDI compatible, though XHDI compatible stuff is most likely to work. With other software I have to rely on quirks to make the protection work. AHDI works (or it does in the pl8 version I haven't released yet) but ICD is an absolute pain, as I said before. Though I'm slighly more optimistic at getting round all ICD's bugs and inconsistencies than I was earlier.
Steve.

The subject line says it all. I have just followed Ted Rossin's instructions on installing TOS2.06 and cannot get the system to boot up. /DTACK does work because there is no BUS error. I'm attempting to install the roms into a MEGA ST4 (REV 4) mother board, via the mega bus connector. I'm taking the /ROM2 signal from pin 20 of the HI/LO-0 rom pins. What could be the problem. Any help would be appreciated.

Thanks in advance.

I understand that there are some floppy formatters that handle HD floppies! Do any of these work on such a floppy connected to an Insite floptical drive? ICDFMT, from ICDBOOT Pro 6.20, does *not* do this on my Mega 4 STfm running TOS 2.06.

Any suggestions?

I am using Turbo C 2.0

Is it possible to make a define in the project file ?

How to specify a second include directory? (I'm afraid it's not
possible at all.)

Thanks!

So Atari spend millions of $$ on creating new technology and software only to stop production ...

I also doubt seriously whether they want to make compatibles at all. Take a look at CBM. They are pulling out of the PC market because it is too competitive and it nearly dragged them under ... (which isn't a bad thing ... :-))
Does Atari always say what its plans are anyway ??? Its only when they have something concrete ie specs and a prototype then they release info but since the Falcon030 and Jaguar have taken all their cash I doubt it ...
I know Atari aren't that good but they aren't that BAD!

Hi there,
I considering compiling GCC-2.5.0 for the TT (i.e. using the
-m68020 and -m68881 options) , but before I even download all 6MB of compressed
source, can someone tell me how hard re-compiling GCC is. Is it just a question
of hacking the Makefiles and running them through an earlier version of GCC
e.g. 2.4.5. , or is there some trick that you need to know?

I am considering compiling it with gcc-2.4.5 and mintlib pl36, on my
10MB TT- do I have enough RAM and the correct includes/libs to do it?

Hope someone out there can help,
Cheers,
Joe.

>Seems ya have to write one.

All a 68010 support is a decent page fault handling. To have function VM
you will need a mmu (a real one, not the standard ST mmu.)

And because you have a non-standard mmu in that case, you also will need
a non-standard VM driver -- which you will have to write.

Source record: 36189

Hiya all!

I've got an Atari 520STFM that has been upgraded to 1meg memory and
I was wondering whether I can replace the four RAM chips on the mini
circuit board that came with the expansion with four different RAM chips
to increase the memory total to 2 or 4 MBytes.

I've seen offers for 4meg expansion at a reasonable price of 99 pounds
in some magazine, but I thought it would be cheaper to replace the 4 chips
I installed with the last upgrade with 4 better chips.

If this can be done, can anyone tell me what type of chips I should try to
get and where I can get some???

Thanks! Mail responses if you are shy or it is a weekend!

Paul.

5220. Hello!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-02 15:56:21 UTC
From: nikhan@erix.ericsson.se
Message-ID: <1993Nov2.155621.8806@eua.ericsson.se>
Source record: 36171

How do I program the DMA sound chip in the atari STE? I can play a sample (from Hisoft Basic in this case), but when I try to have several samples in memory at once, some of them can't be played! They sound like static. Can the DMA chip only adress some parts of the memory? I have made sure that the start and end adress of the sample to be played are even and that the length of the sample also is even. No result (except more static). Here's my program:

```
REM HISOFT BASIC
REM % denotes integer 2 bytes, ! denotes single precision float(!) 4 bytes.

REM Reserve memory
DIM sample%(10000)
sample_adress!=VARPTR(sample%(0))

REM Load sample into memory
BLOAD "a:\data\toobad.avr",sample_adress!
REM Remove the header
sample_adress!=sample_adress!+128

length!=18000
dma!=&HFF8900
REM Reset DMA
POKE dma!,0

REM Sample rate and mono mode
POKE dma!+32,&H81

POKE dma!+2,sample_adress!/&H10000
POKE dma!+4,sample_adress!/&H100
POKE dma!+6,sample_adress! AND &HFF
POKE dma!+8,sample_adress!/&H10000
POKE dma!+&HA,sample_adress!/&H100
POKE dma!+&HC,sample_adress! AND &HFF
POKE dma!+&HE,(sample_adress!+length!)/&H10000
POKE dma!+&H10,(sample_adress!+length!)/&H100
POKE dma!+&H12,(sample_adress!+length!) AND &HFF

REM Play the sample
POKE dma!,1
FOR n%=1 TO 30000
NEXT n%

REM Stop the DMA
POKE dma!,0
END
```

This program works for some adresses. If I add several DIM statements before the DIM sample%(10000) eg. sample2%(10000) etc. the sample sounds like random values are played. BTW, I thougth that the adresses dma+8,dma+&HA, dma+&HC were read-only. Is this true? My sampling cartridge software examples sets them.

Any suggestions would be appriciated. I'd be happy to receive examples in any language (almost :-)). I can't get it to work in assambly language either.

Niklas

I do not speak for Ellemtel.

Sorry thats not all as mentioned in the former posting: think of the Bandwidth the Video-system needs to display 640*400 pixel 25 times per second
compared to 640*480 pixel 60 times per second
... that matters with fast scrolling and crunching ...

OUTPUT POWER TO THE PEOPLE.

Ready on desk - Ready to produce
LC-HQ In/Out Interface for Atari-ST.
(Non-commercial participation.)

Using the Centronics-port, featuring; "everybody can control it
from any language"

Purposes: * Controlling Analog devices (Including precision applications
such as synthesizer voices).
* Controlling Digital devices (directly, relais etc...).
* Programming RAM (and EPROM when some extra interfacing
is add).
* Running-light controller.
* Robot applications.
* Waveform generation.

On this Euro-board directly available:
---

* Data decoder, adress 0...254
* Demultiprexer for 16 channels.
* 6x 8 Bit High precision (0.027%) Digital to Analog
Converters (DAC's)
* 2 DAC's can be directly joined together to create a
Course & Ultra-fine Pseudo16 Bit DAC.
* 8 Bit logic register. (if DAC registers are used for
logic applications: 7*8=56 logic lines).
* The logic registers also can be set as input (by software
control) to read 8 data lines from the outside world.
* Easy to expand upto max 254 x 8 Bit data lines.
* On board precision reference voltage.
* Low power consumption.
* Fits in 19 Inch Rack ("19 connector lay-out)

5225. STalker problems

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-02 18:51:22 UTC
From: ehood@convex.com
Message-ID: <1993Nov2.185122.28781@news.eng.convex.com>
Source record: 36176
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've discovered a problem with STalker line history scrollback buffer. Anytime I call 'tset' on a Unix system, STalker will no longer save any lines in the scrollback buffer.

Also, I've noticed that STalker has the occasion to lose a character or 2. Also, I cannot figure out how to get a 80x24 character window on a 640x400 display using the default system font (Using a smaller font is too much of an I strain). STalker only allows me to resize to 80x23.

Personally, I think Uniterm is more robust (and faster), but it will not run on a Moniterm Viking. Plus, it cannot run as a desk accessory like STalker.

Has anyone else had these problems?

What software is out there that will let me load more than 6
desk accessories? I tried using DC Stuffer, but it seems to
srew up the system path and NeoDesk will fail in it's auto
execution.

I'd like something that is robust and is proven to work on
non-standard ST displays (i.e. 3rd party graphic boards).

Hello,

To compile gcc you'll need a Minix fs and MiNT. Get the files update33.zoo
and update34.zoo from atari.archive.umich.edu, together they contain the
patches to the standard gcc distribution to make it run on ST/TT/Falcon.
I have compiled gcc 2.5.0 first as a crosscompiler on a Unix host and then
as a native compiler.
The prepatched gcc sources as well as binaries linked with MiNTLibs pl 39
can be found at ftp.twi.tudelft.nl:/pub/atari

I have also made the Objective C compiler and runtime. They work for me...

As it was expained to me, Atari has stopped building the Falcon because they wre only building it on a need/order. Also, the stock was hovering at 8 points until AFTER they made the announcement on Friday. It was lsat at 10 3/8 last I checked.

-Mark Santora

BTW, I am not an anti-atari man as many have flamed me due to my bringing this information out. I own 3 ST's and really don't enjoy the idea of support being dropped for my favorite machine.

Try MultiDesk Delux, from Codeheads (Charles F. Johnson.)

CodeHead Software
P.O. Box 74090
Los Angeles CA 90004
(213) 386-5735

A lot of people do not like Codeheads for various reasons, but this
program is very nice. You can load or dump .ACCs at will, and you're
confined only by memory. Plus there are other goodies.

The software I know of to allow more than 6 DA's in at once are DC Stuffer (as you have already mentioned), MULTIDESK (DELUXE) by Charles F. Johnsson (codehead software?).

In my opinion, Atari's answer to the 6 DA limit was to ignore them, and instead turn to CPX's. I think that they are now widely abused. The Control Panel should be used for control, surely?

The other alternative is Chameleon. Whilst it does not allow more than 6 DA's in at once, it allows you to load and unload accessories into the space it occupies, solving most problems of the 6 DA limit.

One thing to watch when using Chameleon on older TOS versions (pre 1.4 I think) is that when you chameleon something in whilst in an application, quitting the application will not give you back its memory until you chameleon the accessory out again. Similarly, when you chameleon something in whilst on the desktop, then run an application, dechameleoning the accessory will not give the ST back that memory until the application is terminated.

```
Hi,

I'm using TOS 2.0 (started as a program from out of the
AUTO folder).
When starting a .TTP I have problems with the parameter passing:
for instance the parameterline: "-x -v -f dvp\xa.sar dvp\xa"
leads to following parameters received by the program:
argv[0]="";
argv[1]="xa"

=> everything before the last '\' is removed.

BTW I've been using Turbo C 2.0 for the development of the .TTP

Any hints / work arounds ?

Thanks in advance
Rainer

LEG>Is there any sort of device/cartridge/etc that I can hook into my 1MB
LEG>520ST that would give me more than 1 rs-232 port?

There is a S'hard'ware project in progress here in Germany that gives you two additional serial ports. It is announced that they will work with115kbaud simultaneously in an 8 MHz ST. Beta version are already working.

I don't know too much about the project, but I'm sure that the release of the first non-beta version will be announced.

> I KNOW IT WORKS WITH SCSI ONES!!!!!

No need for shouting. First, there is no such thing as an ACSI-to-RLL
controller. There are ACSI/SCSI host adapters and there are controllers
that convert SCSI to ST506 (RLL or MFM drives). Julian is quite right
when he says that HDX only uses SCSI commands (in ACSI disguise, of
course) and no special magic, even with Megafiles.

> : There's no such thing as a `low level' format. HDX uses that standard
> : FORMAT
> : command. It's possible that in recent HDX versions the support for the
> : old Megafiles (ST506 interface) has been dropped (use an old HDX version
> : then).
>
> once again...RTFM!

Which f*cking manual do we have to read to learn about 'low level format'
commands for SCSI controllers/drives? I've read a lot of SCSI controller
and drive manuals, and believe me, there is no 'low level format'
command. There are small differences, when it comes to handling
defects, but neither HDX nor the Supra software use these defect
mapping capabilities of certain drives/controllers (as far as I know).

> HDX looked for the bad sector map, didn't find it, and left no device selectable
> in the Format dialog. After (low-)formatting the disk with the Supra, HDX did
> it again, as Supra made a new bad sector list.

Aha! Now we're coming to the point. The Supra software didn't "low-format"
the drive, it was just smart enough to figure out what to do with
a drive that had not been formatted before. HDX is quite touchy here,
but these problems do not have anything to do with low-level
formatting voodoo - just a little laziness on the programmer's side.

> Use AHDI 5.X. It's the fastest, as it doesn't look too much for IDE devices on
> bootup.

It may be fast at bootup time, but AHDI in general is about 10% slower
on the ACSI bus than some other HD drivers. This figure is valid when
it comes to transfers of large sector chunks. I don't have the figures
here for small transfers.

To speed up the boot process, most HD drivers can be configured
so that they only check certain ACSI/SCSI/IDE targets (and not
all of them).

You have to use a resource construction kit like Interface (>=2.0) where you
can load the spdicon.rsc and deskicon.rsc. Then you drag the Icon in
spdicon.rsc into the deskicon window.
Save it, restart and select it via Menubar.

REMEMBER: DO NOT DRAG ANY ICONS IN THE DESKICON, BECAUSE IN NEWDESK.INF
IS ONLY THE INDEX OF THE ICONS, i.e. you will end up with messed icons.

|> type to do different things, like for example displaying a picture, moving
|> sprites etc)
None of the above. You will have to write your own routines to do graphics that aren't GEM or VDI based.

|> Which is the easiest to learn and use/cheapest/your favourite (in that order :-))
|> program to use?
|> (I have heard Lattice C is good)
I like Lattice C and it's intergrated environment. I suggest you go out and buy a good book on C such asthe Waite Groups C Primer plus to get a feel for the C language and what it can do for you. Next get some Atari C source code - especially graphics based stuff to see what is involved. Then maybe consider getting a compiler - they're not cheap so make sure you know what your getting. Don't expect anything like STOS or whatever with lots of pre-done graphics/sound commands.

|> Are there any books/faqs/etc to read about programming C?
There is a C FAQ. Probably in comp.sys.prog.c or whatever the C programming group is called.

|> Will a general book on C be of any use or will it be specific to a certain type
|> of computer e.g. PC?
Many books are sort of PC or Unix specific. The one mentioned above is fairly generic. To be honest, even a PC specific book will teach you enough to write C on the ST. You'll need to get something like the Atari Compendeum to show you the ST specifics.

I used to get something like this when I had memory problems in my STFM.
I was installing a 4Meg board, some connections were loose, used to get a
screenful of bombs on startup.

When I found the problem, it was a memory chip connection on a simm.
Must have been intermittent.

Hello!
If you don`t need your MIDI-Port, you can "convert" it easy into a RS-232-Port!

Only a view wires, one ore two Ic's (top multiplex the CTS/DTR/RING etc. Signals)
and there ist a new RS-232! AND: It can run with 38400 Baud!

In a German Atari Magazin (ST-Computer) was a description for this "operation".
IF you understand German, I can copy it for you..
I don`t know, if a translation is made...

Have a nice day

Jens

I don't know if it will work on a Falcon, or with multicolour icons, but
you can move icons from rsc files to another rsc file with Codeheads
Icon Juggler. Shareware.

I recommend Geneva if you want to abolish the six accessory limit. Geneva
is very compatible. It not only allows you to have as many desk accessories
as your memory will allow, but alllows you to terminate or load them at any
time. (Note that some desk accessories don't get along well with being
terminated, but most do.) Plus you get all of the other advantages of Geneva
like multitasking GEM applications, a new item selector, a whole new look
including 3D buttons for ANY Atari, and much more.

5249. Looking for info about using old PC hard disks with STs.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-03 13:34:25 UTC
From: adw@ukc.ac.uk
Message-ID: <6424@eagle.ukc.ac.uk>
Source record: 36096

I am hoping to obtain an old PC hard disk for free(ish).

What I'm looking for is information from anyone out there who has used an old PC hard disk with their ST. I have read the FAQ, and not wishing to spend any money, I have decided not to go via the adaptec-SCSI-SCSI adaptor-ST route.

At the moment it is my intention to build an ST compatible hard disk controller of my own using a variety of components that I have to hand. Does anyone have any experience of this?

Finally, any tips for software - is there any PD stuff that I can use to format and partition and otherwise support a hard disk, or will I need to write my own? Are there any good (free) sources of information on these kinds of subjects?

Thanks in advance,

Lloyd.

I think Atari DID used to make some PC-clones, but I don't believe they were ever released in the U.S. (for some reason, I'm thinking they were in Canada, though). The problem with clone-making is that there are quite a lot of competitors doing clones, and thus the profit margins are getting hurt - and you need half-decent profit per unit, or the reasons to produce the product become less convincing...

I don't know what's causing the problem, but you don't need single precision numbers for memory addresses. HiSoft BASIC 2 has a DMA library which should help. For memory addresses use & (long ints).

In Germany, Atari sold the last computers from it's DOS compatible ("ABC")
line at the end of last year.

I don't think they did make much money with it.

I was frustrated by the less than full terminal (80x24) mode of Stalker until the beginning of last year, when I bought a TT. Everything works great in 640x480 with 16 colours.

I know that's not much help but it did solve my problem :)

But seriously, you may want to install the overscan modification into your ST, to increase your monochrome resolution. Some one else may be able to help you with how to get your hands on this modificaton.

Are you talking PRINTED manual, or online help/menus?

Check your files - is there one called CONNGER.HLP and CONNGER.RSC?
If so, rename CONNECT.HLP to CONNENG.HLP and CONNECT.RSC to CONNENG.RSC
then rename CONNGER.HLP to CONNECT.HLP and CONNGER.RSC to CONNECT.RSC
and voila! a German online help and menus...

(I believe those are the correct names)

Then again, I have a PRINTED manual in GERMAN (and it takes too long
to look things up) - I'm just happy about the online help - it makes
life easier...

>to increase the memory total to 2 or 4 MBytes.

It is my understanding that memory in the ST is organized into two
banks, each of which can hold either 0.5 or 2 MB. A 520 upgraded to 1 MB
typically has two banks of 0.5 MB. Depending on how the memory upgrade
is done, it can be quite easy to take out the 0.5 MB and replace them
with 2 MB, giving you a total of 2.5 MB. I once did that with my ST. On
the other hand, the memory on the motherboard cannot be upgraded, so
unless your memory expansion board does not have an option to hold two
banks, you cannot use it to upgrade your computer to 4 MB.

5264. PROPOSAL: Palette Handler

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-04 06:22:24 UTC
From: warwick@cs.uq.oz.au
Message-ID: <16210@uqcspe.cs.uq.oz.au>
Source record: 36113

DRAFT PROPOSAL

"For centralized colour handling
in multi-application environment."

by Warwick Allison
warwick@cs.uq.oz.au

Under a multi-tasking environment on a palette-based display, applications should co-operate to make most efficient use of the palette.

Since the palette is a shared resource, a central resource allocation scheme is required, especially when the palette is large but not infinite (ie. 256 colours). It should be in the OS, but it isn't.

The model proposed uses a desk accessory, CPX, or concurrent program, called "the Palette Handler" to which requests can be made, and from which allocations are gained.

This is a draft proposal. If we can get it right, it will make life a lot easier for programmers, and a lot prettier for users.

Here is the model:

(Colour==Color throughout)

For each palette entry, the Palette Handler has a "Lock" flag indicating if the entry is:

1. Free
No application can use it until it is locked.

or 2. Locked
The colour can not be changed until it is freed by
all applications using it.

or 3. ExclusiveLocked
The colour can be changed freely by the owner.

The Lock can change state when the applications make a request.
The possible transitions, and requests that cause them are:

Free -> Locked GetColour by some app
Free -> ExclusiveLocked GetExclusiveColourIndex by some app (now owner)
Locked -> Free FreeColourIndex by all apps
Locked -> ExclusiveLocked Not permitted (what would it mean?)
ExclusiveLocked -> Free FreeColourIndex by owner app
ExclusiveLocked -> Locked LockColourIndex by owner app

Application functions:

```
int GetColourRGB(int rgb[3], int toll[3]);
int GetColourHSLV(int hslv[4], int toll[4]);
int GetColourCYMK(int cymk[4], int toll[4]);
-1 = no free colours, else index to use.

int GetExclusiveColourIndex();
-1 = no free colours, else index to use.

void FreeColourIndex(int index);
void LockColourIndex(int index);
```

RPC's go via evnt_messages.

ACC/CPX functions:

1. View state of locks.
2. Change colours.
3. Change locks. (forceful and novice)

or

1. Only from script file. (uses no ACC slot)
eg. lock some colours.

Deficiencies:

This proposal needs to be extended to allow the "one palette per application" model - where the palette changes when the window "in focus" (ie. on-top, or mouse-inside) changes.

Perhaps this can be done by making ExclusiveLocked colours just per-application. ie. with a 16 colour palette, every application can set N Locked colours and 16-N ExclusiveLocked colours, but must restore its palette and palettes of other programs itself.

Questions:

Do we implement:

safe, expensive - remember id's of all apps who lock,
and only honour one lock.

or co-operatively - only remember the count of
number of locks, and trust apps to
only FreeColourIndex's they have locks on.
eg. Free = 0; Locked = #locks; Exclusive = -1

or both. (ie. let user decide if apps are trustworthy)

Do we:
Remember the "average" colour of a locked colour, and keep it at that? (sounds cute, but confusing to user).

Other thoughts:

If the VDI is TrueColour, or maybe even if <16 colour, the desk accessory
doesn't install itself [is that possible?].

I am now using Gribnif's Geneva. I can load as many accessories as my 4 megs will allow, and remove them at will. If I terminate programs (accs) in reverse order, the memory is freed up (not fragmented). It's great to run STalker, STFax, Maxifile, XCONTROL, Idle (screen saver), G-Plus+ (acc), and still be able to load EdHack or something else, use it, and terminate it.
You don't have to rename your accs either; they will load as .ACC or .ACX, and you can put the ones you want at boot up in a seperate folder, and set a PATH= in Geneva.

If you have uudecode on your Atari, you could uuencode the file, download it
as text and uudecode it on the Atari. Another possibility would be to get
xmodem for Unix somewhere and compile it on your server.
Otherwise you probably would have to get one of these programs from a friend
on disk. (One of these programs: uudecode/Uniterm/Kermit).

No. Flopticals are SCSI drives, no disk drives. They are handled
completely different from a hardware programmer's point of view.

I can't tell from that description. Try the following tests:

- disconnect the mouse
- remove floppies in the disk drive
- press the ALT key during the power-on phase

From: andrew@minster.york.ac.uk
Message-ID: <752419408.4693@minster.york.ac.uk>
Source record: 36050

Can someone tell me how I set up gcc (preferably with debugger, and other tools, libraries, etc.) on my Falcon? I've tried but I've probably forgotten one little thing which is making it not work.

I'm also trying to set up a minix partition on my Falcon (I don't really like the short filenames and backward slash of the IBM's standard). I've set aside a 25Meg partition which is currently left unused on my external SCSI drive, and I want to use this. What shell, or desktop will I need to take advantage of this?

I'd like to set up a shell, etc. to work in TOS and MTOS so any further experiences and advice would be appreciated.

Please e-mail with any help to: andrew-atari@minster.york.ac.uk

>welcome this, as I occasionally want to create executables for
>the plain vanilla STs here in the institute.

Could try this:
Write a set of functions to call instead of the fpu library functions, and rename the (old) lib functions. Now when your program calls one of these funtions it calls either (old) 68881 fpu functions or (old) software fp functions, finds how your program was compiled from a global, and if it used the fpu functions but your prog was compiled without this option, it copies the result from fp0 to d0/d1.
I don't think this is exactly what you're after, but with a little polishing, you can use one library that uses fpu functions and you're program can be compiled with either option and still work.
Not even sure this is so useful now...
Anyway this illustrates the fact again that even in a (so-called) standard language, you can still fall into holes unless you know how the compiler implements things like floats. Personally I don't think gcc should have done that.

>> without any timing problems!
>So how does memory speed up the STe to 12 Mhz ??
>I thought it would only fetch from memory quicker not run the clock
>cycles at a higher rate ...

Oh dear. The simple act of plugging in a SIMM does FA to the rest of the system including the clock. However the speed rating of a SIMM the the maximum time it will perform a read/write operation in, and therefore the minimun time you should allow it to perform the operation. Now a 100ns SIMM can therefore do 1/10E-7=10000000 operations a second in theory ie the max rate you can access data at is 10Mhz. So if you installed them, you could in theory also buy a 10Mhz cpu and run it at this speed. With a clock speed of 8Mhz, the slowest SIMM you can use in theory is a 125ns SIMM. Most people I think will have 80 or 70ns SIMMs because that is what PC users have, therefore they sell in higher volume and are the cheapest.
The SIMMs must also be 8 bits. PCs use 9 bits so they can be used with an ST - the extra bit is ignored.

I say in theory because you also have to give the system time to handle the data once the SIMM has retrieved it. Basically I think the whole thing gets very confusing when you have to sorts out simultaneous data requests from the video chip AND the cpu (and the DMA chip AND DMA sampling AND the blitter - good grief). Also don't DRAMs need recovery time after an access? I was told on some chips an access would take 100ns or whatever but then you could only use 1 in 2 cycles. Plus theres memory refresh.... I don't know the exact details when it gets complicated like in the ST, I was brought up on a BBC 'B' where life was simple.

Correct ME if i'm wrong too

I have a problem with my SLM605 laser (on the ACSI bus)

Usually it's not plugged in (actually it unplugs it self
when turned off - smart little fix inside the controller)

When I plug it in it doesn't register until I reset my ST

Is there another way to make it active without rebooting
(a small routine to reset all ACSI devices or somthing like
that - a copy of the routine called when the ST reboots ?)

5277. ST reset from Minix

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-04 16:41:13 UTC
From: greg@walrus.encore.com
Message-ID: <greg.752431273@walrus>
Source record: 36126

Several weeks back I asked for help on some Minix and MiNT/minixfs problems.
Thanks to some suggestions from Frans Meulenbroeks, I got 'reset' to work
after Minix has been running. I'm guessing one of the C:\AUTO\ programs
setup state which is overwritten by Minix, but which it expects to find
on the reset. By clearing both 'resvalid' and 'memvalid', I get a clean
reboot on reset.
If you are having reset problems from Minix, I suggest the following:

```
*((long *) 0x420) = 0; /* memvalid */
*((long *) 0x426) = 0; /* resvalid */
```

Is it viable to mix different types of SIMMS. What I mean is can we mix 9 bit an 8 bit SIMMS in an STe, and can we mix say, 70ns SIMMS with 100ns SIMMS?

I don't know what type the SIMMS in my ST are...they are the 3 chip versions. I got these from WTS Electronics(UK) a couple of years ago to upgrade from 1Mb to 2Mb

Can we mix 3 chip ones with 9 chip ones?

I have a Moniterm Viking (1280x960), so window size is not a problem
there. It is bothersome if I'm working with the standard color
monitor. Someone suggested use a 14x7 font, but I as a user, should
not have to resort to such measures. For all I know, the window
problem can be do to GEM and not STalker.

My major concerns are those of 'tset' and character loss. If Uniterm
knew how to deal with the Viking, I'd probably never use STalker
(however, having it as a desk acc is nice). STalker scrolling is slow,
and its vt100 emulation seems to have some minor problems. It does
have some nice features(run as desk acc, link to STeno, BackTalk), but
concentration should be put into getting the core functionality stable
and not on the bells-and-whistles.

I'm still mystified why executing 'tset' on a Unix machine will
screw up the history buffer in STalker.

BTW, is there a way to contact Gribnif (via e-mail) so consumers
can report bugs/problems on Gribnif software. The company I
work for has such services, and it helps us in making better
products and in servicing our customers.

From: EMERSON_EMI@bdt.COM
Message-ID: <CFzFG5.Czq@bdt.com>
Source record: 36131

Hello Gang,

I am interested in programming for the ST family in C.
Some Questions I have:

1)Will Ian's Heat and Serve C produce well-behaved code from
well behaved source? I don't need floating point but I do
need GEM and I also will be working with large files and SCSI
send and receive commands? Is version 1.49 (cc) the latest?
V1.8 of Gemfast? (dated 5/92)

2)Pure C in English yet? Availible in US yet? How is
Lattice in comparison? Or should I think about GNU C?

3)What about RSC editors? Can I use the one that came with
my copy of Mark Williams C? (I did't want to use MWC 3.0
'cause its been unsupported for a pretty long time and I
never have used it so I don't know if it's any good, any
opinions?

4)How does one best learn to program GEM? I have 1 through
13 of the ProGem series, is there more? I need some more
basic material to start me off.

Thanks all, more knowlegeable than me, who reply.

P.S. The reason I think HSC may be buggy is that the examples
are buggy, Minicolr.prg hangs my system (mega ST 1.2). and
Browse, another example, bombs with Windowed ACCs. Also
MasterBrowse 3.2 is the only program I've seen written with HSC
and it is none to stable, either. However this is not a slight
against Ian Lepore's work which looks great and is well
documented. I don't have enough experience to see if it is the
source or the compiler (or if a newer version addresses all
these problems).

Please send emailas my net news may be erratic (there are some
messages I know I haven't seen.

Pete, again you go off and say the future is 3do--hmmm can you say "$700 waste of money?" I myself have seen neither machine, but have the common sense to realize that a machine that costs less than a vcr will certainly be more widely and easily accepted by homeowners vs a $700 gadget that MAY be more utilized in the future. I don't believe the average american will spend $700 on that... As for the stock price--it will probably hit $13 and hover +-$1.00--that's what the price was at IPO a couple of years ago. And--if Atari starts to make money and issuing dividends--the stock will again rise as the stock becomes less speculative. I wouldn't encourage anyone to sell until some reports come back on Jag sales in the two test markets.

Now, do you have anything intelligent to say? I hope we can have a more constructive and positive relationship with you Peter. In fact, we enjoy working with humans....

As for STalker loosing characters, try turning off your blitter chip (if you
have one) and also turning off Warp9/QuickST (again, if you have it). Let
me know if it helps!

By the time that the cdrom option is released and the Jaguar is manufactured in volume, the price of cd30 will decline to the Jaguar's price point. Plus 3do will be sold by many firms with advertising budgets.

5288. TOS2.06 in MegaST4, having big problems.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-05 01:43:10 UTC
From: rdt154k@monu6.cc.monash.edu.au
Message-ID: <1993Nov5.014310.22823@monu6.cc.monash.edu.au>
Source record: 36134

The subject line says it all. I have use the TOS 2.06 installation details
provided by Ted Rossin (sp?) a while ago to install TOS 2.06 into a
Mega ST4. I have fitted the cct onto a pcb which plugs into the MEGA BUS.
The MEGA BUS details I obtained from ATARI and the rom's from a supplier
here in OZ. My problem is that the /DTACK response works ok but no data
is read (rom's are 100ns speed) and the /ROM2 signal specified for booting
has no effect. Any help at this point would be most appreciated.
My Mega ST4 has a REV4.0 board if thats of any help.

Thanks in advance.

Hi,

I'm considering to buy a TT for DTP and I might add a graphics card to it eventually. I'm told though, that in order to be able to work with a card and , say, a multisync you'll still be needing a seperate monitor for booting. Does anyone know if this is true and, if yes, what kind of screen would do for this purpose?
BTW: my preference is based upon a seeing a (accelerated) Falcon030 and a TT-with-card doing the same job, but I'm still in for useful hints. Who?

Thanks in advance,

Paul

First off, you can get to Gribnif three different ways over the Internet.
You can send mail to me at stewart@titan.ucs.umass.edu, or to Dan on GEnie
at GRIBNIF@genie.geis.com, or to Rick on Compuserve at
75300.1131@compuserve.com.

On to the STalker questions:

Let me start by saying that I don't know exactly what a UNIX tset does, but
I have two likely scenarios for the problem. The first is that it causes
the whole screen, including the scrollback to clear. The second is that
it causes STalker to use only the first 24 lines of the scrollback.

The first problem is actually very common, and is the way STalker is intended
to work. The scrollback on STalker is not really a history, but a virtual
screen. Most of the time, you can basically use it as a history, but if the
host system issues a clear screen command, that's what STalker does. The
BackTALK command set_int_param can be used to change this behavior. So that
instead of clearing the screen, STalker will just move down a line. However,

this only works in VT-52 and PC-ANSI emulation modes.

The second possibility, where STalker ends up using only the first 24 lines of the scrollback is something I've personally seen the most using emacs. If this happens to you, just tell STalker to reset the communication port, and the problem will clear up. This is most likely a bug in STalker, and should be fixed when we can get the time to do a newer version. We also want to change the way clear screen works in the next version to be more consistent with the way most of our users seem to want it to work.

Character loss in STalker is usually due to buffer overflow, and can be avoided by using the AUXINIT program which comes on the STalker disk.

The reason STalker is slower than Uniterm is because it is a GEM application using GEM text, instead of TOS text like Uniterm and Flash do. The advantages to this are several. Firstly, it works on your Moniterm. It also allows STalker to work as a DA on a regular ST, and therefore allow background downloads. Finally, it allows it to work on multitasking systems like our new Geneva, and MultiTOS.

The fact that it is a GEM app is also the reason why you can only get 23 lines on a color screen, since it has to leave one line for the menu bar. GDOS and a different font is a nice solution to this, if you don't mind the additional bit of a slow down. I usually get by fine with 23 lines. :)

Look in wuarchive for the kermit desk accessory, I can't remember the name
of it, but I got it there, it worked great with FLASH. e-mail if you can't
find it, and maybe I can dig it up for you.

BTW, you must have a terminal program running that allows you to access your
desk accessories. I also have a copy of C-kermit for the ST. (it should
be available on wuarchive also).

>of hacking the Makefiles and running them through an earlier version of GCC
>e.g. 2.4.5. , or is there some trick that you need to know?

You don't have to hack in files. Just get the latest updatenn.zoo (I
think nn=32..34 and higher would be interesting for you). There are all
necessary Patches and Makefiles included for making your own cross- or
native-compiler for any ATARI.

> I am considering compiling it with gcc-2.4.5 and mintlib pl36, on my
>10MB TT- do I have enough RAM and the correct includes/libs to do it?

MiNT Lib PL39 is the latest public release. First you should make new
libraries with -m68020 -m68881. Then you compile the new gcc with your
old gcc. Then you should compile the new gcc again but now with the new
gcc. 10 MB is really enough to do that. ;)

Never use the -m68881 option without -m68881 Libs and vice versa!

The latest release of gcc is 2.5.2.

If you were succesful, I'm interested to know about.

Bye,
Knarf

Not true necessarily, two ways to resolve it, get a Multisync Monitor that
has two monitor connections i.e. one from TT to Monitor and one from Graphics
Card to Mointor..and voila...problem solved, it will automatically switch from
one Graphic Mode to another...

Second solution is, make sure that the Software you have to boot up your system
has some kind of Compatibility mode that will allow you to run your entire
Atari on your TT via Graphics Card...now nearly all professional applications
will run on gfx boards...

>would do for this purpose?

An IDEC, or the new 19" Sony, Eizoscreen I thnik also has two connections..
there are plenty :)

>BTW: my preference is based upon a seeing a (accelerated) Falcon030 and a

For DTP? Definately a TT with a nice fast Graphics Board like the N_V_
(4 Letter word starting with....N!!!)

:)
grin hahahaha

anyway, ask technical solutions in the Netherlands, they do
DTP stuff there as well as ATLANTIS...I think was their name...

Hmm...possible. Phillips' CD-I has a very significant jump on the 3DO's potential market. If 3DO ends up not being competetive with Phillips in their market (and Phillips does own that market right now) then 3DO is only going to be part of a very few rich people's short-term future.

We'll see, eh? :)

The Atari Jaguar, at ~1/3 the cost of the 3DO, is really not going to do much competing directly. It really seems like a nice machine with software equally nice -- based on what you, me and everyone else has seen/heard, what makes you think the Jaguar will flop?

To tell you the truth your idea seems contrary to every source i've seen -- seems that the Jaguar is already quite popular in the minds of many people. I think we've all seen and know that the potential is in the machine to have truely fantastic games. I'd say that Atari's pricing is very comparative to all their present competition.

In this light, why _do_ you think the Jaguar will bomb? I can't think of anything that really tarnishes its record thus far...certainly not to the extent of "bombing."

Have a day.

5301. SH204 options?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-06 14:18:59 UTC
From: millsp@govonca.gov.on.ca
Message-ID: <1993Nov6.141859.15713@govonca.gov.on.ca>
Source record: 36048

I currently have a 1040 STe attached to an old SH204 hard drive. Being tired of dealing with the 20mb capacity, I'd like to replace the mechanism with something larger.

The disk that's in there is a 5 1/4 Tandon MFM. Can I simply exchange that with *any* other MFM that physically fits? Are there track/sector limits or electrical constraints?

There also seems to be a board in there that converts SCSI to MFM. Does that mean I could bypass that board and install an internal SCSI drive in the case? If so, what constraints would I need to be concerned with trying to make *that* happen?

5302. SH204 options?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-07 05:12:00 UTC
From: chuck.mariotti@canrem.com
Message-ID: <60.13694.4019.0N1897A3@canrem.com>
Source record: 36051

Yes you can get a SCSI OR MFM drive in your SH205... I'd suggest a recent drive. (Get SCSI, they are a whole lot easier to use and maintain, and fast)... I would suggest a Quantum SCSI drive... Like a 127MB.. They are very low consumption and have very little heat from them. It is a plug and go situation, however, I'd suggest getting ICD's ICD Hard Disk PRO Utilities. They are a god send. Enables caching AND many utilities for you hard drive...

5303. Color Palletes

Newsgroup: comp.sys.atari.st.tech

```
================================================================================
=== RE: DRAFT PROPOSAL - Centralized Color Handling ===
=== "Other Approaches and Solutions for Pallete Management" ===
===------------------------------------------------------------------------===
=== Warning : Long Post, posted in E-Mail and c.s.a.st.tech ===
================================================================================

Warwick,

I've read through your proposal for "Centralized Color Handling".
I'm not sure exactly how it works. It seems as though it provides
a cooperative lock on the pallete which is NOT the desired effect.

First, centralizing the approach is only going to be useful if you
can efficiently get all the information needed to determine what
pallete should be used when. Now, my idea of when pallete switches
should occur must differ from yours.

The way I see it, a pallete switch should occur when a particular
window or dialog is on top so that particular entity is shown in
the proper colors. OS support would mean either giving every window
a separate pallete or giving each application its own pallete and
having the AES do the switching when a window top message is sent.

You can make a centralized approach by looking to see what window
is on top in a specific desk ACC, and then switching to that particular
stored pallete (registered with the ACC either with a GEM event or
a pipe or some combination, perhaps a form of the drag-n-drop protocol).
If a window is on top which belongs to an unregistered application, then
the ACC should automatically inquire the current pallete and register
that application with the ACC. Instead of locking, it switches, which
actually is more colorful.

The most obvious method though, is to forget centralizing and supporting
of older programs and instead just switch to your pallete whenever your
application tops a window. This is a decentralized approach and should
work quite well. And the application is free to set its colors as it
chooses including having a different pallete for every window in the
program. However, when you switch to an application that doesn't set a
specific pallete, you wind up with the new top window or top application
possibly being in the wrong colors. In no case should you EVER try and
restore a color pallete when using this approach. The other applications
will get the TOP or ON_TOP or whatever messages and take care of the
pallete switch. If you try and restore the colors, you could wind up
creating a race condition which is totally unnecessary.
```

The decentralized form is more efficient since it doesn't have to constantly inquire about which application owns the top window, and its a bit more flexible. The centralized approach supports older applications providing they set the pallete on start-up and not later. Both approaches ensure that the pallete will be kept correct for the application that supports the protocol, and any number of applications may be used (memory permitting, maximum of 768 bytes per pallete plus 2 or 4 for the app_id).

I personally like the decentralized approach (having each application set a specific pallete when it tops a window, even if it just resets the pallete that it found on start-up). What is really required though, is to FIX the problem. This should be possible using an AUTO program.

Fixing the problem would involve trapping the AES and VDI so that when a program calls appl_init(), an array is allocated for that program which is initialized to the color pallete of the desktop. Every time the VDI changes a color, the same change must be made to the pallete array for that program. When the wind_set(WF_TOP ...) call or the form_dial(...) calls are made the patch should restore the pallete from the proper array. This would be both efficient, centralized, and would require NO programmer or library support, and older applications should conform automatically. The AUTO folder patch would be used until ATARI (or Eric Smith, I bet he'd fix things if someone just wrote the code for the patch and E-mailed it to him,) actually fixed MultiTOS.

I'm not exactly sure how the VDI and AES are called since I don't program assembly. I know it involves setting up an array, and I would guess that some form of trap is called after that, which would mean a vector that can be stolen in an auto folder TSR. I would asume (ass-U-me) so anyway, which would make the AUTO patch possible.

Finally, here is my proposal, a mix supporting all 3 methods and not requiring much but some conditional code and programmer support. First, Check the cookie jar for the "_PAL" cookie, set by the AUTO patch (we'll break the rules and use the underscore since this should be an OS feature, and =WHEN= support is added to MultiTOS, ATARI can use the same cookie name) and if that cookie exits, we assume we can change the palette any time we want and forget about it. If the cookie is not found, we have to look for a desk ACC called "PSWITCH.ACC" and register our color pallete with this ACC every time we change the pallete. Finally, if that ACC is not running, then we can use the decentralized approach and explicitly set a pallete (for at LEAST the first 16 colors to support GEM objects and changes in RSC files since GEM objects can have up to 16 colors) every time we top a window. This way we support 3 different methods so the user can choose between the AUTO vector grabber or the ACC or nothing depending on how his system is set up and the programs he runs, and programs will not break or have side-effects when the problem is finally fixed. This proposal would be in effect from the time of acceptance until a version of MultiTOS that supports automatic pallete switching is released AND is being used more than previous versions of MultiTOS. Maybe we could mix this with some form of locking too if someone wants it. I'm just not totally sure how the locking will work. What happens when the pallete is

locked? Does it just not change?

No matter what approach is used, there are always a couple simple rules. I think everyone knows these, but if followed, only picture display programs (which could <should?> be full-screen using a wind_update followed by a pallete switch and display, when finished, it returns the pallete, calls wind_update to free the screen and calls form_dial to redraw) will require pallete management. First, only a picture display program or the control panel should EVER change colors 0 and 1 (normally white and black), and since GEM objects can have up to 16 colors (but no more) try not to change the first 16 colors without really thinking it over first. Finally, picture display programs and VDI calls should change the pallete in the upper color indices first, before changing GEM colors. If you want to have colored backgrounds and foregrounds, make the background of your object or dialog the exact opposite color (from the standard 16) and set the SELECTED bit on (this doesn't work for SELECTABLE objects, but should be OK for touchexits and backgrounds). Try it out sometime. It looks right, but the difference is that you can still read it in resolutions with less than 16 colors, even mono! It always works providing you keep the foreground normal and the backgrounds reversed. You can then use all sorts of color in a dialog.

Anyway, I definately think switching is a better solution than locking the pallete. I really don't see a good use for locking anyway, and if I was to create a locking approach, I'd simply use semaphores via MiNT. Also, while there is nothing that can be done for MONO, 4 color programs could possible massage more color out of the system by flipping palletes, much the same way that FZDS Terminal uses a different pallete for its menu screens than its online screens. 16 color systems are pretty colorful already, and I don't see a need for pallete management, unless you want to switch tasks while a program is displaying a picture in a window. Again, it may seem like a good idea to just let the picture displayer handle this but this WILL lead to a race condition, and it is not the answer. Hopefully, some ideas will be sparked by this message (over 100 lines! I bet the AUTO patch needed to fix the problem isn't this big!!) and that some sort of workable standard can be created ASAP so programmers don't have to change there programs all the time.

CYA
Evan Langlois

evanlang@sdf.lonestar.org

P.S : Here's a side-note to those of you who want to write programs that use more than 7 windows and have them work with normal TOS too. These guidelines apply to when running in TOS mode, not when MultiTOS is running. First, only use a MAX of 4 windows, so that ACCs can work. Second, when writing an ACC, if you can't open a window, use a dialog. Last, if the application can't open a new window, or already has 4 open (even TOS 1.0 =CAN= open 7 windows, its just the desktop that limits itself to 4) then instead of telling the user to close a window, automatically close the bottom window and keep a record of where that window was. When the user

toggles between windows, using a hot-key or menu entry, automatically open and close the windows so that your internal window list (which can hold as many windows as you like) is walked by the 4 open windows. When a window is closed, walk your list and restore one. Its a nice way of dealing with alot of windows since the user won't ever USE more than 4 at once anyway.

>demo by Brainstorm...

The DSP cannot be used in the same way as the FPU (68882).

The DSP works on streams of data. For example, a Fractal program
that generates a stream of pixels on the screen.

Math libraries provide single instructions on single inputs. For example,
pow(x,y) takes 1 pair of doubles and returns 1 double.

If you wanted to find 1000 pow() results, the DSP might be faster, but
programs just aren't written that way in general.

>that with *any* other MFM that physically fits? Are there track/sector
>limits or electrical constraints?

Yes, as far as I know, you should have no problems doing that. There should be no track/sector limits. However, you have to take into account, the power required for the drive mechanism, plus the requirement for the two boards. Most of the drives nowadays are low power anyway, so you should not come across any problems...but do check.

>There also seems to be a board in there that converts SCSI to MFM.
>Does that mean I could bypass that board and install an internal SCSI
>drive in the case? If so, what constraints would I need to be concerned
>with trying to make *that* happen?

You most probably have 2 boards in the case.....ACSI -> SCSI and SCSI -> MFM.....such a waste of time....such a slow process. The ACSI -> SCSI is also probably a BMS-100, and you should be able to directly connect a SCSI mechanism to this, totally bypassing the SCSI -> MFM (Adaptec?) board. I don't think there are any constraints to consider here, but maybe other netters know more. The only things that I can think of are the setting of the SCSI ID and power requirements.

Hope this helps.

Hello, I need some help with a term paper. I'm doing a 10 page paper on
UNIX for PCs. So far, the only pc unix I have played with is SCO and being
a beginner unix person, I really can't say if its better than any other
unix. So I was woindering if some of you kind souls could email me
some information. Such as requirements and abilities, and personal
opinions would also be appircate it. I have some information on SCO,
Solarous, Unixware, and BSD.
I presently run os/2 at home and use a sun station at work so comparsons
to these would be helpful.
Also if you have any information on the Unixes for non IBM clone pcs
such as the Amiga and Atari St, I'm more than happy to here that too!

Thank you very much.

5309. PROPOSAL: Palette Handle

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-08 14:34:00 UTC
From: cybercube.research@canrem.com
Message-ID: <60.13700.4019.0N189952@canrem.com>
Source record: 36056

Hi Warwick,

we've read your Palette Proposal with great interest. We produce the CyReL SUNRISE M16-1280 True Color High Resolution Graphics Cards for the Mega STE and TT030.

During our many tests and ongoing driver developments, we've come across the same problems (global and local palettes) as you've outlined in your proposal.

The problem was even more aggrevated when we introduced the CyReL Ambiance Desktop Image Manager (a utility which allows you to install a multitude of images, layers and palette fades as a replacement for the dull desktop background).

For that we had to 'split' the available palette. There had to be the regular OS colors (0-15), the colors for the background (with a max of two layered images, so we had to reduce & compute an appropriate set of colors for that) and colors allocated by programs such as DTP (Calamus) or drawing programs (Papillon, Chagall, Studio Photo etc).

Since many of these programs now use e.g. the 6x6x6 RGB cube, it would make sense to try to propose a universal color handling scheme, one with a central color request/distribution technique to avoid several incompatible approaches that will probably just end up producing a color 'mess'.

We would certainly be very interested to discuss these ideas and such a proposal in more detail.

Ralf.

5310. Falcon hardware debugging

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-08 16:53:51 UTC
From: kesseler@arthur.crpht.lu
Message-ID: <KESSELER.93Nov8175351@arthur.crpht.lu>
Source record: 36057

For those who didn't know it:

If your internal IDE drive stops working at higher temperatures then you have the same problem I had.

If you have trouble with the DMA-sound output (one channel is missing) or you hear nothing from the TV or RGB-monitor then you have the same harddisk problem.

What ???

Yes, the internal harddisk is screwed too tight and so there are bad contacts and short circuits appearing in the audio part of the Falcon and if it gets too hot the drive can't expand and gets twisted so that the head cannot find the tracks anymore.

To solve this problem without removing all those 46 screws proceed like this:
Remove the cover.
Remove the loudspeaker, you have to bend the metal things holding the loudspeaker in it's position.
Through the hole you can now see the screws where the HD is attached to the motherboard. Loosen the screw which is closer to the monitor port and the sound should reappear and you can even use the F030 in summer.

Bye,
Georges.

5311. ("AJAX") 1772 diskdrive chip question

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-08 19:55:30 UTC
From: hallvart@ifi.uio.no
Message-ID: <2bm87i$jit@holmenkollen.ifi.uio.no>
Source record: 36058

I've heard that to upgrade an ST with a 1.44MByte disk drive (under TOS 2.06) you might have to
change the diskdrive chip (which I believe is one called 1772 if I remember correctly) so that
it works with 16MHz instead of 8MHz like the 720KByte disk drive uses.

Does this involve just replacing the old 1772 chip on the ST's motherboard with a new "AJAX" 1772
and connecting a 1.44MByte disk drive in place of the 720K?
...or is there something else involved?
By the way, how much does the new chip cost, and where is it available?

Hallvard Tangeraas, Oslo, Norway

5312. Trackball (Alfa Data TKB-MT-AC)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-08 19:56:58 UTC

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi folks,

I recently bought a trackball made by Alfa Data, the type name is TKB-MT-AT. Unfortunately, it turns out that the ball itself as well as the axles for the x- and y-direction have smooth, hard surfaces, and they tend to slip past each other. This makes precise control of the mouse pointer quite difficult. Especially moving the mouse in a direction that has a small angle with respect to one of the axes is next to impossible.

I have tried coating the axles with pieces of rubber tube of various kinds, without any satisfactory result. Does any of you know a trick how to fix this problem? Does any of you have experiences with this type of trackball, or another one?

Greetinx & thanx in advance, Jan

Source record: 36060

I have a MEGA 4 STE which did not come with the 1.44 MB drive.
I purchase a 1.44MB disk drive from a friend and I simpley replaced
the old 720k drive with it, The only modification I had to make was to
switch one of the dip switches inside so TOS would allow me to format
to 1.44 MB. I have one of the older STE with TOS 2.05. I have yet to
encounter any serious problems. However, beware when switching 720k and
1.44 MB disks in the same drive as the system does not automaticaly
recoginize the change in disk types.

5314. enhancements to MiNT

Newsgroup: comp.sys.atari.st.tech

Message-ID: <2bmdp3$1qm@disun41.epfl.ch>
Source record: 36074

I have a poor old 520st with 2.5M and probably 4M pretty soon (as soon
as I feel like grabing that !@%$@% solder iron again). Being a unix
fan, I'm doing anything I can to make my ST look as much as possible
ike a (very small) unix box. Four problems are showing up:

- speed
- memory
- speed
- memory

for the first and third problems, there are a few hardware solutions,
but there is also a software one: an interrupt driven device driver
that would make a 'cp' from floppy to floppy take 1% of CPU time
instead of 99% (f.ex)

for the second and fourth, again except costly hardware solutions
(especially as soon as I need more than 4M) I can see two software
ones: shared libraries (I think a dynamic-link-loader (a la
LPR-modula-2) would be nice) and process swapping (like make-processes
(and others) waiting on gcc's completion).

I have no MiNT internal knowledge and limited time, so I won't
probably implement any of this (or maybe one, who knows?).
Is anybody working on such things (or do they even already exist ?) ?

Stefan

Normally, your startup code should provide the necessary information, i.e.
with the mintlib there is a variable called _app which is set to nonzero for
a normal application and to zero for an acc. You might want to look into the
source for details.

Regards,
Ulrich

5318. Re: PROPOSAL: Palette Handle

Newsgroup: comp.sys.atari.st.tech

From: error@stack.urc.tue.nl
Message-ID: <2bnv3r$rhq@tuegate.tue.nl>
Source record: 36064

I agree that a palette handler is something that is useful and that should be added to the OS. I already asked Atari unofficially if they could add one ;-)
Now for my comments:
since running a multitasking OS like MultiTOS is probably the only occasion (apart from DA's) where several applications have to share a systemwide palette, I suggest MiNT messages are used becaus there are some drawbacks to using gem event messages.

To make the most of the available colours apps should be able to request a certain colour. And if they don't really care they should be able to ask for a colour within a certain distance (e.g. looks like red ;-) of a colour, or even ask for a colour different from the following colour (va_args).
Or if the app wants to be really nice, it may ask for the colour closest to some colour.

Erlend.

I keep hearing numbers around 15,000 which isn't very much but better than nothing! FWIW, Hisoft, in a magazine article recently said something to the effect that they know exactly how many Falcons have been sold and they are happy to support it based on those figures. They certainly have a lot out/on the way at the moment.

5324. CPX and appl_init

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-09 16:36:40 UTC
From: hn@limotoc.informatik.rwth-aachen.de
Message-ID: <hn.752863000@limotoc>
Source record: 36069

Writing my first CPX module I encountered the following problem:

I've to call AES functions (e.g. objc_draw to draw the cpx
object tree), but I don't have a valid global field in the AESPB:
Due to the fact that the CPX module didn't make an appl_init call
it does not have an AP_ID and the other stuff appl_init returns
in the global field.

So what to do ?
- use the invalid global field (i.e. zeroed): In the days of
MultiTOS this won't be a good idea...
- search the XCONTROL Accessory AP_ID via appl_find("XCONTROL"):
no good idea, either, because with this method I will only
get the AP_ID, not the other stuff in the global field.
(moreover it is not guarantied that Xcontrol has the name
"XCONTROL"!)
- call appl_init/appl_exit each time the CPX is called:
Probably the best idea!

All CPX examples I saw use the first method, but I think the third
is the best solution.

Any suggestions?

J. Sullivan (js10039@hermes.cam.ac.uk) wrote:
: >> YES! It's PERFECT! With 100ns, you even can speedup your STe to 12 MHz
: >> without any timing problems!
: >So how does memory speed up the STe to 12 Mhz ??
: >I thought it would only fetch from memory quicker not run the clock
: >cycles at a higher rate ...
: Oh dear. The simple act of plugging in a SIMM does FA to the rest of the
: system including the clock. However the speed rating of a SIMM the the
: maximum time it will perform a read/write operation in, and therefore the
: minimun time you should allow it to perform the operation. Now a 100ns SIMM
: can therefore do 1/10E-7=10000000 operations a second in theory ie the max
: rate you can access data at is 10Mhz. So if you installed them, you could in
: theory also buy a 10Mhz cpu and run it at this speed.
_I_ got my 120 ns SIMMs working at 12 MHz clock rate.
Simple thing: Replace oscillator & piggy-back an extra 7474.
But: you need a multisync.

: I say in theory because you also have to give the system time to handle the
: data once the SIMM has retrieved it. Basically I think the whole thing gets
: very confusing when you have to sorts out simultaneous data requests from
: the video chip AND the cpu (and the DMA chip AND DMA sampling AND the
: blitter - good grief). Also don't DRAMs need recovery time after an access?
: I was told on some chips an access would take 100ns or whatever but then you
: could only use 1 in 2 cycles. Plus theres memory refresh.... I don't know
: the exact details when it gets complicated like in the ST, I was brought up

No problem, as you speed up the _whole_ system.

: Correct ME if i'm wrong too

That's one part of the problem

>and connecting a 1.44MByte disk drive in place of the 720K?
>...or is there something else involved?

There is, my old MEGA STE couldn't use 1.44 even with AJAX and TOS 2.06
because of a missing jumper on the main board (to enable 1.44)...
My newest MEGA STE has this jumper/strap (ST's does not have it)

Is there a compiled version of MinTLIB 35 or higher? I only have source and most of the stuff compiled, I want everything pre-compiled.

What's a good (and SMALL) version of MicroEmacs to get? Is there anything friendlier that I might want to try?

Can someone tell me about Curses? I mean specifically how to use them with TERMCAP strings and such so I can write software that can use any terminal type?

Is there a termcap based window library?

Does anyone know how to make a persistent C++ object where the functions are also saved on disk, AND the object can be re-read by other programs which do not specfically understand that object (weren't compiled with that functions header). Is this similar to dynamic linking?

Does anyone have a GEM recorder that can be comtrolled by both the user AND an application (through events or messages of some sort). Would anyone want one for either macro building or program demos?

My G++ library didn't have the delete function in it (the compiled form of delete.cc). Where can I get one that works? I've patched everything up and it seems to be working, but I don't know what else might break, so i'd like to get a working copy (patchlevel 20 or greater).

Does anyone have/use Objective C?

Does anyone have a list of the functions/objects available in G++ library and how to use them? My C++ manual doesn't go into much about iostreams and standard functions other than how to do the basics and how to overload your own functions and put your objects into the iostream. It gets into the programming and philosophy and how-to's and assumes that the compiler has a manual (bad assumption).

Where are the GCC/G++ manuals? I want ASCII, how do I get it? Or, if ASCII is not available, how much hard disk space do I have to waste in other programs just to read some docs?

Who is getting tired of all these stupid ass questions??
Thanks,
Evan Langlois

Pretty pathetic: 15,000 sold in two years. Heck, Apple shipped about that many
AV macs in one day. Come to think of it, there are more Newtons out there
than there are Falcons. The same fate will happen to the Jaguar due to Atari's
inept. Sports fans, it's time to move on.

Check the contents of register A0 in your startup code. If it is 0,
you're running as an ACC. (Or was it the other way round? Correct
me if I'm wrong.) Normally, your compiler startup code does this
for you and sets a flag of some kind that you can check. (C compilers
set the _app flag.)

I have an ICD Advantage SCSI + adapter (IE the same) hooked to my Mega ste
too. The difference is that I have a Atari host adapter and an internal
drive, too... And for me it worked well with the AHDI driver. I didn't use
it very much (I prefer ICD's one with write caching) and I booted on the
internal drive. But it worked well and read the external drive fine ...

Regards, Patrice :)

Certainly that is possible. There is only one real restriction:

You can't send from different sources to the same reciever. That would
be a mess ;-)

MS Windows has some very nice ideas towards palette handling and the
requesting of colours, but also some very annoying habits; the
implementation is badly thought out though as well. However it would
be a good source of reference.

the simple answer is yes, it really is incredibly flexible. Each of the four inputs can go to as many outputs as you want (provided each output is linked to only one input...). So the ADC could be linked to the DSP receicve _and_ the DMA record at the same time that the DSP transmit was linked to the DAC...

You need some hardware that detects if there is a HD or DD floppy disk in
your drive and switches the clock frequency for the 1772 floppy controller
accordingly to 16 or 8 MHz.
I have bought such a thing from "digital data deicke" in Hanover, Germany
for ~65DM (~$40).
It requires that the drive has an output signaling the type of disk
inserted. My TEAC drive and probably most others has this feature.

Well mind you :), NOVA already has this with the EMULATOR Program, and it
works probably in the same way as Redirect will, at least it sounds to me this
way.

The 15,000 figure is just for the UK, which I expect is more sales than the
Newt. At about 500 quid each I know which choice I'll be making!

5347. WINX and UIS

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-10 16:08:47 UTC
From: C.J.Ridd@cs.bham.ac.uk
Message-ID: <CGAA6o.953@cs.bham.ac.uk>
Source record: 35993

I've just managed to get WINX 2.2 running, by removing basically
everything from my AUTO folder.

As I put things back one by one, I noticed UIS 3.32 didn't work any
more. Also I couldn't get TOS14FX5 working anywhere.

Two questions:
1) Is TOS14FX5 useful if you use SERFIX11 and WINX (WINX fixes
appl_find, which TOS14FX5 also claims to do)?
2) Has anyone got UIS working? It runs, but the grotty old TOS 1.4
file selector keeps appearing.
3) The sysbase OS variable (0x4f2) points to the OS header, one field
of which is another pointer to the OS header. What's the difference,
and should one be used and not the other?

That's three questions, sorry...

Thanks in advance!

Are you sure? I thought it was just a convention, a happy medium. Any user of FastCopy will know that you can change the # of sectors/cluster to suit your system, and TOS will happily use it.

Yes.

> I somehow doubt it, but then how do those programs that
> do real-time audio effects work?!?
They work exactly like that.

What you can't do is connect 2 inputs to the same output because the matrix
has no adder build in.
So you can define in total 4 datapaths (4 destinations). One input can be
connected to multiple outputs (i.e. AD -> DSP,DA)

>to fix this problem? Does any of you have experiences with this type of
>trackball, or another one?

I own one of these myself and the fix is so easy you'll be amazed;

Go out and get some nice fine steel wool, wrap it around the "trackball"
iteslf, and make that nice gloss finish a nice matte finish. From then on it
will work fine. You don't need to rub it much, just until the gloss finish is
gone.

I also took mine and put it up on little rubber feet (from Radio Shack), so
that the platform of the trackball is the exact same height as the rear of my
Mega keyboard, then I sat it behind the rear of the keyboard on the right so
that when I use it my hand can rest on the back of the keyboard. This is far
more comfortable than having it elsewhere on the back.

Good luck!

Maybe just do a "nice" on the command. I forget the syntax (which
will be obvious to many here), but something of this notion:

nice -2 cp *.* d:/stuff

...where nice will set the priority (and possibly speed things up
overall (but of course slow down the copy in return)...

>for the second and fourth, again except costly hardware solutions

I just got the Atari Compendium and I don't see any bios or gemdos commands to send SCSI read or SCSI write commands. I want to talk to a sampler, NOT a device that is not a mounted drive, so how do I go about this? Likewise no sectors are involved, just reading into a buffer, etc.. I'm not that fluent in SCSI theory and ID's however the device does not need a lot of different SCSI commands. Just SCSI READ and SCSI WRITE, basically. Without a BIOS level routine will it be necessary to write a routine for the ST(E) and then the TT SCSI and then Falcon SCSI, or even to the point of differnt versions for different ASCI to SCSI host adaptors?
What information is there for writing .xfs drivers for MULTITOS? And What format do the CD ROM drivers support? True the only work well under MULTITOS?

Yes, but with "little" modification. I don't recall the exact pins,
but two of the wires need to be switched. Power, ground, etc. are the
same, it's the X and Y connections that are different.

This will have some effect, but I think it will not be that great. cp
spends most of its time in the OS. A state in which (I think) there
is no context switch. 'Good' scheduling algoritmes are hard to find.

>>for the second and fourth, again except costly hardware solutions

> Anyone? Does u:/proc fit this description? It just struck a
>memory, so I thought I'd bring it up...

I don't know what you mean, but normal tos programs have the problem
that ones they have been loaded in to memory they are relocated (all
adres value get increased with the begin adres of the program or some-
thing). So if you swap them out, you must swap them in at the same
place as where they came from! This is rather tricky i think. On the
other hand base/pc-relactive programs/processes do not have this
problem, so it should be possible for them, unless i'm forgetting
something.

Just my $0.02,
Gerco.

> Can the Amiga mouse be used on the ST with little or no modification?

I believe the answer is yes. I seem to remember seeing instructions for this in a text file somewhere. Apparently, the wires from the connector in an Amiga mouse are not soldered, but use smalls jacks of some sort instead. To get one to work on an ST, you simply have to rearrange a few of the wires (just by unplugging and replugging them inside the mouse, no cutting or soldering). If I can find the instructions, I'll post them.

As promised, here are instructions for Amiga -> ST mouse conversion.

----begin included text----

Below is a decription of the mod need to be made to a Commodore Amiga mouse
to get the mouse to work on an Atari ST. The Amiga mouse offers a faster
(slightly) tracking rate and two very comfortable buttons to use. The
mod is easy to do and provides a very nice mouse. Enjoy!

Commodore Amiga mouse -------> Atari ST mouse

This is the mod for a Commodore Amiga mouse conversion to ST mouse. No
big deal about the difficulty of the conversion, but still be careful
about what you do. I have included the original wire order by color so
that if you do mess something up, it is here. If the wires in your
mouse are different colors, I suggest writing down the color order before
starting in case you switch the wrong wires. Then you can go back to
START and begin again.

OK...here it is. All it involves is switching two wires on the connector
going to the mouse circuit board. I'll give the before and after views e
of the connector wires in order from back to front (of the mouse).

Before To use on an Atari ST
--------- ----------
Black Black
Blue Blue That's it!
Brown -----\ /-------- Yellow
Orange \/ Orange
White /\ White
Yellow -----/ \-------- Brown
Red Red
Grey Grey

Like I said, the mod is not difficult. The standard disclaimer applies.
I cannot take responsibility for any misfortunes that may befall you
because of your using these plans for the mod. I have performed this
mod and I know it works. I ripped the whole mouse apart trying to figure
it out before I found out I just had to switch two wires. If you need
help with the mod, ask someone you know who has the expertise to do it.

Good luck!

Bruce Blanar

5361. Falcon-specific header files

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-11 05:07:16 UTC
From: bgilbert@cs.washington.edu
Message-ID: <1993Nov11.050716.19642@beaver.cs.washington.edu>
Source record: 36003

Hi all!

I have recently been programming in GCC on my Falcon030 4/84 and I've run into a snag trying to do some Falcon-specific stuff. This would include such functions as Soundcmd(), Devconnect(), Vsetmode(), plus all the DSP calls.

What I need are the header files/libraries that go with these functions. The standard GCC stuff does not cover any of the new functions so I have to resort to calling them by XBIOS number (ick!).

Are these header files freely distributable, and if so where can I get them? I'd hate to think that I need to buy a commercial C package (or the dev package) just to get the proper bindings, although I must admit Lattice C looks like a much nicer development environment than GCC. :-)

Regards,

Yeah, I saw that too. It doesn't work if you put it before GEMRAM,
between GEMRAM and WINX or after both. It appears to be a GEMRAM bug
(not filling out the new OS header structure properly).

There is a fixed version of UIS III, I have been informed.

My SM124 monochrome monitor has a problem. When it is cold it inverts the colors. Once it is warm it also does this if I access the floppy drive. There are are 40 faint vertical lines in the picture also. Can anyone suggest what components might cause thie problem. I'm handy with a sodlering iron, but I have not had to diagnose monitor problems before!

As far as I know, the global field is output only. The AES never uses what's in there.

LSD: Your monitor will work on your falcon if you buy a ATARI-adapter plug, but the specs of the monitor are 2 small for your Bird.. It is bestt to save some money and buy a decent monitor... Things you can do on a SVGA, you cannot on a SC1224.. Good luck with your Falcon (if you have already bought one)!

To me that doesn't sound like a monitor problem but a problem with
your shifter. Otherwise access to your floppy would unlikely have
an effect on your monitor.

If your drive has more than four partitions you won't be able to boot from
it with any other driver because the ICD partitioning scheme is not
compliant to the AHDI 3.00 release notes. With four or less partitions it
will work.

I don't think this is strictly true, the DSP does not work exclusively
on streams of data, the data/program memeory can be used for some
maths routines effectively. The atari OS DSP bindings allow for
64Kb to be put into the DSP memory and theoretically can do calculations
on it. I am not completely sure as I have just started reading the manual
but hope springs eternal.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

Can anyone out there tell me how to get dialog boxes in windows in Lattice C ?
I'm writing my final year project on my Falcon and desperately want to have a non-modal interface (ie the appearance of a dialog box doesnt lock up the program until the user dismisses it). To do this I need someway of handling multiple windowed dialog boxes... in the same way something like WinRec does for example.

I got hold of WindDial but have had no luck getting it to work, so has anyone managed to get it working with Lattice C ?

Any help _gratefully_ received!

Ian

Hi Ofir,

-> Valid idea in my opinion. I like the whole concept of palette
-> management although I don't think I have much to contribute myself.
-> It is a worthwhile project.

Maybe you could act as a coordinator in England. We would certainly like to offer our support to Warwick's proposal/idea. We have some good connections to several companies in Germany as well as here in North America.

And given the size and complexity of the task, we will only be able to achieve a noticeable effect when we make this issue a more 'global' effort. There are enough challenges ahead. Would you like to accept?

5387. Amiga mouse on Atari ST? Serial Mice as well?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-11 20:01:00 UTC
From: cybercube.research@canrem.com
Message-ID: <60.13746.4019.0N18AB96@canrem.com>
Source record: 36036

-> Can the Amiga mouse be used on the ST with little or no modification?

Why would you like to use the Amiga mouse on an ST?

I have to admit that I have a special reason to ask you this. We offer a software driver for the Atari ST/TT/Falcon that allows you to use any industy standard serial mouse (read IBM AT mouse etc) on the Atari!

You can also use the same driver to hook up a SUMMAGRAPHICS MM1201, MM1802 and 961 or BITPAD2 graphics tablet to it.

The serial mouse can be used IN CONJUNCTION with the regular mouse since they do not interfere with each other. No matter if you choose a Microsoft or PC-Systems compatible mouse, you will be able to use it as long as it has the right connector (for a regular ST you would probably need an DB9->DB25 adapter, which is included with mose mice).

Price? Just US $13 (+ S&H (US $1 for USA or US $2.50 eleswhere).

If you need more information, please send e-mail.

Ralf.

5388. Compiling EnhancedGEM for Lattice C v5

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-11 22:13:35 UTC
From: imr@cs.bham.ac.uk
Message-ID: <1993Nov11.221335@cs.bham.ac.uk>
Source record: 36039
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I made a request a while ago for help with windowed dialogs under Lattice Cv5,
I was recommended to use E_GEM as this provided what I needed and many other new
window widgets. The only problem is I can't get it to compile to the .O file that
I need. I get really stupid errors complaining about missing semi-colons even
when there's a semi colon there!

So anyway enough ranting has anyone managed to get E_GEM working with LAttice C
and could you _please_ tell me how ?

Cheers

Ian

Of course, process swapping is not exactly trivial. Relocation can be redone when bringing the code back in (or you can use pc-relative addressing) but you still have problems with programs storing function pointers.
But maybe the number of programs using that feature is not too high so we could add a "swappable" bit somewhere in the executable. Or even change the compiler so that the function pointers are expressed relatively to the basepage. Of course, this wouldn't be too good an idea in conjunction with shared libraries whose relative address may change. But of course, the compiler could also implement function pointers by adding an indirection: the c-function-pointer would just be an index in a table of actual function poionters.

Maybe this is all too difficult to implement right. The two other "options" seem much more accessible (the shared library could even be rather simple: replace any "lib_call(args)" by a "*libc_calls[LIB_CALL](args)". The value of libc_calls would be given by a "library process" to whom you ask for a library and who loads it if necessary and returns the base address (and asks MiNT to share memory...))

5390. SIPPS to use in a Memory upgrade ....

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-11 23:57:22 UTC
From: karlm@highett.mel.dbce.csiro.au
Message-ID: <2bujh2$70k@news.dmpe.CSIRO.AU>
Source record: 36034

Hi.

Yesterday some kind soul donated me 4 SIPPS that I am going to use in a memory upgrade for my 1040STf. Now I know that they are Japanese RAM, and that they're 80ns, but I don't know if they are 256k or 1mb. Here is my (dud) ascii rep of one of the chips on the SIPP.

BTW They are 30 pin 9 chip babies.

```
+------------------+
| 81c1000-80 |
| 9012 T34 |
| PJ BC |
+------------------+
```

Thanks for your help!

Best Regards,

Karl.

No, the Atari SLM laser printers are not parallel printers. They connect
to the DMA port on the back of all Atari computers except the Falcon.

Does anybody know how to set up kermit in Uniterm for a standard C-Kermit server? Whenever I try to use it, the file I download gets a few Kbs of garbage added to it. Any suggestions would be greatly appreciated.
Please post any suggestions or email me at rbrand1@gl.umbc.edu

Thanx,
Rob

(I'm assuming that we're talking SLM804 here, the posting was not specific). The 37-way on the printer connects to the controller (SLMC-804), not to the DMA port. A further DMA cable connects the controller to the DMA port.

I recently picked up an SLM804 very cheaply, but it did not have the controller box. This cost me 70 quid, therefore doubling the cost of my printer (ouch). And then 40 quid for the toner. And then I had an accident with it, and have an awkward cleaning job to do :-(

Hi all there !!

Is anyone out there familiar enough to the TOS, that he/she can make up
a list including all TOS-Bugs known to yet and their fixes ??
I thought of a list looking like below:

```
+-------------------------------------------------------------------------+
|TOS-Version | BUGS | Fix(es) |
|------------+-----------------------------------+---------------------------|
| | | |
```

where each known bug is listed with a short description _what is the result of
the bug_ and which program should be used to fix it, and how it is done.

Thanks a lot to the one/them doing that list

Ciao

Atari set its standard with the AHDI 3.00 Release Notes in summer 1989. It
took ICD more than 4 years to get their software adapted to the official
partitioning scheme explained in theses notes.

There is no generic SCSI READ or WRITE command. And furthermore, XBIOS
only has support for SCSI READ and WRITE for harddisks (DMARead, DMAWrite).

> basically. Without a BIOS level routine will it be necessary to
> write a routine for the ST(E) and then the TT SCSI and then

'Just' ACSI, TT-SCSI and Falcon SCSI.

> MULTITOS? And What format do the CD ROM drivers support? True
> the only work well under MULTITOS?

Get the MiNT sources. MetaDOS supports ISO9660-CDs. The XFS too, but it's not
yet releases. Of course it works with plain MiNT too.

I don't think Kermit in Uniterm has settings as such. I do this UNIX-ST
transfer all the time and it is bloody slow. I found that files would come
out corrupted, unless they were UUencoded on the UNIX machine, sent via
Kermit in ASCII mode, then UUdecoded on the ST.

Are you running C-Kermit in Server mode? I founf this a lot easier than
using send and recieve. Just type server at the Kermit prompt, then press
Alt-T in Uniterm. Use 'Disk Utils' to set the correct path on your ST
(note this is not saved in the UNITERM.INF file), and then use PUT and GET
to do the file transferring.

Well, normally if you talk about the connectibility of a device you look also
from the device's point of view. Or is the port on your printer the output?
For me it's still the input to the printer.
So the AD is the input to the matrix, and the matrix is the input of the DSP.
But the DSP is the output of the matrix...
If you start to swap that around... have fun :-)))

: transfer all the time and it is bloody slow.

Of course it does! The whole menu of these. Similar stuff on Unix
side is achieved by ~/.kermrc file.

Your transfers are bloody slow because you are using a default block
size, which is 94, and is meant for a very, very noisy lines. Set
block size to 1024 (I think that this is max for Kermit on Uniterm,
although current kermits can do much bigger blocks and windowing protocol)
and speed picture will change in a drastic manner. Unless your line
is really noisy, then you will have experiment which block size gives
you the best throughput. Do not forget set CHK to type 3 (CRC and not
checksum).

: I found that files would come
: out corrupted, unless they were UUencoded on the UNIX machine, sent via
: Kermit in ASCII mode, then UUdecoded on the ST.

You are obviously sending binary files in a text mode. They will come
corrupt that way, no doubt about it. You have to send binary files
in a binary mode (kermit -i on a Unix side). Receiving kermit will
adjust automatically.

In case you wonder why a difference between text and binary modes,
try to send ASCI text file as a binary to EBCDIC based machine and see
what you will get on another side. With ASCI Unix machines you may
lock both kermits in a binary all the time, but then line terminators
on text files will not come out properly. Not a very big deal, if you
know what to do about it.

Peeking into documentation from time to time is an activity which has
some advantages.

Thankyou. I realise now I was talking rubbish. I thought I had scanned all the Uniterm menus, but I found a little one tucked away under settings... You can always trust someone to put you right! Thanks. I have only been using it for a few weeks.

: Of course it does! The whole menu of these. Similar stuff on Unix
: side is achieved by ~/.kermrc file.

Great. I've changed them in Uniterm, but I don't know anything about the .kermrc file. Kermit is installed on our fileserver, and that's all I know. Could you tell me briefly about it?

: Your transfers are bloody slow because you are using a default block
: size, which is 94, and is meant for a very, very noisy lines. Set
: block size to 1024 (I think that this is max for Kermit on Uniterm,

Yep I just changed that in Uniterm, but again, how do you change it in C-Kermit?

: You are obviously sending binary files in a text mode. They will come
: corrupt that way, no doubt about it. You have to send binary files
: in a binary mode (kermit -i on a Unix side). Receiving kermit will
: adjust automatically.

I do know and understand about binary/ascii files. I switched between them in Uniterm by the [binary] button. I thought this would set binary mode in C-Kermit and Uniterm. Obviously not.

: Peeking into documentation from time to time is an activity which has
: some advantages.

I have read the entire Uniterm Doc a few years ago, but not since I used it. I've got absolutely loads else to read. The only doc for C-Kermit I can think of is by using 'man kermit', which I will try. I hadn't thought of this.

Thanks again for correcting me. I am honestly not as stupid as I must have sounded - Just new in the comms field.

Why could I not reply to you via E-mail? It just came back with a service unavailable message.

Wow, it sounds like the street price on these guys has really dropped. My
cost me $500 used. Although, I did get UltraScript as well. My only real
complaint is the noise. I used to have the cable unplugged until I
actually needed the printer. Now I have a switch box.

Source record: 35968
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,
I'd like to know whether PCspeed or ATspeed can access the serial port
via the PC-means, i.e. ordinary COM-ports. I'd very much like to
hear from people using this configuration. Any info on usable
comms-packages would also be appreciated.

The reason I ask is that our company is setting up an X400 mail/news
service, for which you need to run a PC-package. Since I don't have a
PC, I am thinking of buying a PC-emulator.

Thanks for your time.
Bye,

5416. MiNT suggestion (UROOT= mint.cnf option)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-13 15:43:52 UTC
From: cherborth@semprini.waterloo-rdp.on.ca
Message-ID: <H.eg._ciQGas6MaM@semprini.waterloo-rdp.on.ca>
Source record: 35969

I was going to propose this to the MiNT mailing list this week, but I forgot to (I get the mailing list at work instead of here)...

While I was trying to get Hermes UUCP to work under MiNT (see my other article in comp.sys.atari.st), I thought my problems would be solved if there was some way to create files on the root of the universal drive (U:). Creating a simlink from a real drive (for example, c:/filename) to the universal drive (ln -s c:/filename u:/filename) didn't work; Hermes still failed to create its file properly.

Does anyone else think it would be useful to have a new option in the mint.cnf, uroot? The uroot option would tell MiNT where to physically create files created on the virtual U: root directory. For example, if I had:

uroot=c:\some\path

and I created a file "u:/filename", it'd actually show up on my C: partition as "c:/some/path/filename". Naturally, it'd be a better idea to have your uroot point to a minixfs partition or a ramdiskfs partition to allow for non-DOS filenames like the U: drive already allows... For example, since I rename my L: drive to be u:/minix, I could put:

uroot=u:\minix\not.the.U.root

and any "u:/filename" would appear in "u:/minix/not.the.U.root/filename".

Would this be too much work for too little gain? I suppose you'd have to be careful not to create a circular simlink, but I suspect the kernel already finds those types of errors. Comments?

>
> I believe I've got everything to get GCC up and running, but I am not sure
> which environmental variables need to be set. Could somebody please send me
> perhaps a cshrc.csh or mint.cnf file that has all of these settings in it?

Here's part of my mint.cnf file... I don't let tcsh touch these
environment vars.

```
## Handy symlinks...
## programming files
sln g:\gnu u:\gnu
# For dumb flex port... was hard-coded to look for c:/lib!
sln g:\gnu\bin u:\lib

## Major overkill here!
setenv TMP u:\tmp
setenv TEMP u:\tmp

## GNU C environment variables... (What do we need?)
setenv GCCEXEC u:\gnu\bin\
setenv GNUEXEC $GCCEXEC
setenv GNULIB u:\gnu\lib,u:\usr\lib
setenv GNUINC u:\gnu\incl,u:\usr\incl
setenv GCCLIB $GNULIB
setenv GCCINC $GNUINC
setenv GXXINC u:\gnu\incl++,u:\gnu\incl++\gem++,u:\gnu\incl++\ams
setenv BISON_HAIRY u:\gnu\bin\bison.hai
setenv BISON_SIMPLE u:\gnu\bin\bison.sim
```

You won't need the BISON* env vars unless you're going to use the GNU
bison compiler as well... I'm not sure whether GCC et al use $TMP or
$TEMP for their temporary files, so I set both (some programs use one or
the other anyway).

You needn't have a switch box: you can open the back of the printer (where the papers go out) and the fan stops.

There exists a cable to connect a SCSI peripheral to a DMA port. But does (or will) a cable exist to connect the SLM804 to the Falcon (I used the SLM804 with a Mega ST, but now I have a Falcon :-) ?

>and could you _please_ tell me how ?
>
>Ian

Yes it is possible compile E_GEM under Lattice but a lot of changes are
required. Your missing semicolon problem is not actually a missing semicolon
just some declaration incompatibilities with Pure C (I think mainly the
AES declarations are different). Your real problem is working out how
to use the library once you've compiled it, since there is no documentation.
I've given up for now, waiting hopefully for the next version which might
have some more info on how to actually use it. I wish Atari would come out
with an official library for supporting enhanced features. Of course
if you live in Germany then I believe there are a number of libraries
available, both commerical and PD, unfortunately none have made it across
yet, however, if HiSoft are going to sell Interface (from Shift) then
we will have a Lattice compatible library (assuming they translate it
for Lattice), but until then....

5421. Re: PROPOSAL: Palette Handle

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-14 04:21:17 UTC
From: evanlang@sdf.lonestar.org
Message-ID: <CGGs3H.5xI@sdf.lonestar.org>
Source record: 35900

I think a more detailed explanation of the proposal could be in order, as far as how it will be implemented, and how programmers would use it. It would also be nice if someone were to write a "draft" handler.

Just my 2 cents as I'm interested in this idea, but its still a bit vague as to how it will actually work on my system. This is one of the hardest things to program as far as bugs and miscelaneous problems - who knows what other applications will do to the pallete!!

Also, the proposal seemed to cut out 4 color and true-color. If I understand true-color properly, then you have 256 pens to draw with, just like a pallete with the only difference between 256 color mode and true-color mode, is that colors that are already drawn do not disappear, but if an application sets color 6 to red and draws with it, and some other application sets color 6 to green, then while the first application's drawing is still red, if it draws again, it will be green, even though it thinks the color should be red, so it would seem that true-color modes should be treated like 256 color modes and they need a handler!!

4 color modes should also have one even if its just to let some applications have blue dialogs and others green and others orange, and switch palletes to make it look like more colors.

Flopticals work with all host adapters (at least I think so). You'll need
a harddisk driver which supports the Floptical (AHDI, ICD and HuSHI come
to mind, but there are probably others, too). If the Protar harddisk
software is AHDI compatible, you can use either of these drivers
without repartitioning. But I *think* that Protar used an own format...

5423. Cookie Jar

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-14 06:37:59 UTC
From: evanlang@sdf.lonestar.org
Message-ID: <CGGyFC.9Hz@sdf.lonestar.org>
Source record: 35901

Has anyone ever run out of cookie jar space? I haven't, but I've seen a program called JARXXX that seems to be like FOLDERXXX (which I have never used nor needed, TOS 1.62).

Why not make a standard cookie who's second longword is simply a pointer to another cookie jar, or work out a scheme that copies the whole cookie jar into another larger area and frees the old cookie jar, and moves the jar pointer? Both methods would be from within the applications that are adding to the jar, with the first method requiring application support.

I would just hate to put yet ANOTHER application in my AUTO folder as yet another patch to make the system run the way it should.

In my Frontier Xtra-RAM Deluxe manual it says you shouldn't mix speeds and SIMMS should always be bought in pairs.

However I have read another discusion about this and know of people using two pairs of differing speeds ok.

> pointers.

It is even worse. In order to swap in a process at a different base address, you must relocate *every* pointer in existence, which can live anywhere; on the stack (e.g., function return addresses), in registers, anywhere else in memory. Without an MMU that supports virtual memory (which Falcon and TT have, as I understand it, but ST doesn't) it is next to impossible.

But then, if you do have virtual memory support, you may as well have the OS handle swapping/paging transparently...

```
==============================
Would this be too much work for too little gain? I suppose you'd have
to be careful not to create a circular simlink, but I suspect the kernel
already finds those types of errors. Comments?
==============================

Cicrular symlinks are OK. I did it once (on purpose). I wanted to make
absolutely sure that I did not need foldrxxx.prg, even though someone said
I would need to add an extra 100 folders or so no matter what TOS version
I had.

Well, my Minix drive is D:, my ramfs drive is U:\ram which is aliased to F:
Now I created D:\RAM\ as a symbolic link to U:\RAM and on drive F: I made
a folder called F:\RAM2\ which was a symbolic link to D:\RAM\ !!

It worked just fine, inside F: was RAM, inside RAM was RAM2, inside RAM2
was RAM, inside RAM was RAM2. Well, I just opened that thing up until I
had about 40 or so folders deep and I opened all 7 windows to 20-50 folders
each. My mistake was thinking that Fdelete would delete the symbolic link
so I dragged drive F: to the trash to clear it like I always do.

OOPS! Teradesk does a recursive delete and it finds ALL the files and folders
before the deletion starts. So I put Teradesk into a nice loop. I did a
CNTRL-ALT-C and restarted TeraDesk and it worked just fine. I forgot what
I did to get rid of teh links - I think I just left them there until I rebooted
but I still have D:\Ram.Disk (I renamed the link) to access RAMFS.
```

5429. MiNT 1.09 bug ?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-15 08:59:46 UTC
From: plord@uel.co.uk
Message-ID: <CGIznM.411@uel.co.uk>
Source record: 35891

I've been using MiNT for some time now - compiling up new releases when they are available. However, I have never been able to run more than one desk accessory.

I looked into this a bit further and have come up with a theory ...

I *think* that since mintnp.prg is in my auto folder, the desk accessories are loaded in a multi-tasking environment. i.e. the first one may be still be initialising whilst the second starts loading.

Now, I remember hearing that when programs are run it is given all available RAM and then gives back what it doesn't need to the pool. So, what I think is happening is that before the first acc free's up what it doesn't need the second acc tries to grab all the RAM ..... the effect is that mint falls over with an nalloc - out of space.

Why do I think this is happening? Well, if I turn on all the debugging to slow the boot process up then two accessories can be loaded at once!

Maybe this race condition only occurs when the hard disk is fast compared with the processor ..... I have an STE with a fast scsi drive.

Any comments? Can you load more that one accessory? If so, what is your setup. Perhaps my theory is rubbish and my mint.cnf is wrong or something ....

5431. Installing Quantum in TT

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-15 09:45:53 UTC
From: johan.nordlander@engelska.umu.se
Message-ID: <johan.nordlander-151193103747@nod.eng.umu.se>
Source record: 35980

Hi,
last week I tried to install a Quantum ProDrive LPS 80MB hard drive as the internal drive in my TT. It worked OK initially but when I tried to hook up my Syquest 88MB drive to the system things started to go weird. It either wouldn't recognise the Syquest at all or it would do strange things to file names. All in all, the Syquest turned out to be completely useless together with the Quantum, so I put back my old Seagate to have a functioning system.

My problem is: How am I to configure the relevant hardware adjustments like; parity (disable I assume); SCSI number (0?); termination (is the Quantum drive already terminated, and if so, do I have to remove this termination?, how?)?

The Quantum drive formerly was installed in a Mac II SI, if this will give any hints to the problem.

I would be very grateful for any kinds of clues that will help me to solve this problem.

Thanks on beforehand.

I think he only forgot a small arrow (i.e. AD -> DSP,DA)
should be (i.e. AD -> DSP -> DA) and this is
possible.

Do correct me, if i'm wrong, but is there with base/pc-relactive programs
relocation? I got the impression that all references where added to a
base-pointer (just as in the 8086 :-) at runtime. Now, if you change the
base-pointer you can change the place where the program lives. No sweet
with relocation which is impossible because the compiler/OS doesn't whether to
relocate things like:

```
union u_impossible {
char *bla; /* needs relocation */
int pipo; /* needs no relocation */
};
```

>But then, if you do have virtual memory support, you may as well have the OS
>handle swapping/paging transparently...
Yeah, but since most of us don't have VM, and will not have it in the near
future this is a nop.

pc/base-relative program don't have any absolute addresses in their code
so they don't need to be relocated at startup. But they produce a lot
of absolute addresses in many memory locations while they're running,
since the 680X0 CPU works with absolute addresses on the stack, in address
registers, ...

Consider this example:

```
...
jsr foo(PC)
..

foo:
...
rts
```

The machine code for jsr foo(PC) doesn't contain an absolute address but
the distance between the jsr-statement and the destination address. This
distance, of course, doesn't change when swapping.
But the CPU pushes the (absolute) return address onto the stack, when
executing the jsr-statement, which is needed for the rts-statement.
If the base address changes (because of swapping) between the execution
of jsr and rts the return address on the stack would have to be relocated
first, which is very hard or impossible to determine.

Well, you can make the effective copy faster by persuading cp to use bigger
buffers than 512 bytes. At least my gnu-cp does all i/o in 512 bytes chunks.
But of course you will thereby decrease the chance to catch the process
outside the kernel to preempt it... :-(

If you have a WD1772-PH02-02 you won't need an AJAX.
WD1772PH00-02 MIGHT work too. But they often go too hot.

: >...or is there something else involved?

Yes. Get an HD module if ya don't have an Mega STE.
Or, quick&dirty: install a switch which switches between 8 and 16 MHz :)
works 2, but ya need a steprate of 6 ms.

>I have a Supra hard drive that connects directly to my ST's DMA port.
>Is there any kind of DMA to SCSI adaptor so I can hook it up to a Falcon?

I also have an ST hard drive, so I would be interested in the answer,
although I believe that it should be phrased the other way round ...
"is there an SCSI -> DMA adaptor"

My drive is a "Power Drive", with an internal DMA->SCSI Link, and a
SCSI hard drive mechanism, (its actually manufactured by ICD, um, I
think), but no external SCSI port. Serves me right for shaving 50
pounds off the price I suppose. In principle I could take the case off
and plug a SCSI1->SCSI2 cable directly into the hard drive SCSI port,
to use it as a "bare" SCSI drive with a Falcon. However, if its
possible to avoid opening it up, I would prefer to skip it.

The most recent ST-Format has useful articles on the Falcon, building
your own hard drive from an idiotproof kit, etc etc, but I would feel
more encouraged to upgrade to a Falcon if there was an official Atari
Corps upgrade path, or at least some guidance on questions such as
"Can SVGA monitors be used with a Falcon, or is some adaptor required?
Is there an adaptor available allowing an SVGA monitor to be used with
an ST. Which resolutions are supported. What about support for other
SCSI devices with the Falcon, such as CD-ROMS, tape streamers etc?"

5442. Suggested MiNT enhancements : Comments wanted

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-15 17:31:41 UTC
From: sms@sys.uea.ac.uk
Message-ID: <sms-151193165346@cgpq1.sys.uea.ac.uk>
Source record: 35988

Recently I've been playing about with a few ideas I've had for some features to add to MiNT.

I'm currently writing a MiNT-friendly replacement desktop (See 'Testers Wanted for MiNT-using Desktop' post in c.s.a.s if you're interested...). One of the major headaches is keeping directory windows up to date. It's reasonably easy to keep them up to date with changes made by my program but I'd like to handle changes made by other programs.

I considered the best approach to solving this would be by changing MiNT to provide directory and file watching facilities. I haven't got my notes on this with me so I'm doing this from memory but I will try and explain what I came up with...

Directory Watching

Any directories which are open using Dopendir are flagged (via the directory structure to which directory handles point) when any file operation affects that directory. A function could be provided to check the status for a given directory handle. This would return the flags for the directory and reset them to zero.
The flags needed I think would be :
- Directory has been deleted
- File(s) created in directory
- File(s) renamed in directory (and stayed there)
- File(s) deleted from directory
Of course there could be other flags but there would need to be extra information available to handle this. For example, if a directory has moved - how do we find out where ? It may be possible to implement this too. It would be nice.
I have actually implemented this (the four flags above) and it seems to work reasonably well but I haven't done any rigorous testing yet. As well as flagging when the directory is deleted it unflags the deleted bit if the directory is recreated.

File Watching

To handle tracking a specific file (I want my program to track installed applications and the like), a bit more work is called for.
I thought these functions could be provided:

FileTag Fwatch(char *path);
- Sets a watch on the file pointed to by 'path'
FileTag is a pointer to a structure internally but is just a long

for user programs (like directory handles).

long Fforget(FileTag tag);
- Removes the FileTag id 'tag' so the file is no longer watched.
Can return some error code (Invalid parameter perhaps?) if 'tag'
doesn't exist.

long Fcheck(FileTag tag);
- Checks the status of the file with FileTag 'tag'.
On failure it returns a negative error code.
On success it returns a bitmap of operations indicating what has
happened to the file (file deleted, file moved, file renamed)

long Fpath(FileTag tag,char *path,short pathLen);
- Get the current path of the file.
Various error codes would be appropriate here.
If everything is successful, the current full path is put into
the 'path' buffer.

To support the file moved flag I thought a function could be
provided as such:

long Fmoved(char *from,char *to);
- Tells the OS that we have just moved a file from 'from' to 'to'.
This can handle the necessary flag setting and delete the
original file 'from'. Thus to support this programs would just
have to replace the Fdelete part of their move code to use this
new function. Of course if a program didn't support this it
would just be a Fcreate and a Fdelete which would at least be
passed on to any watching program but it would be impossible to
know if the file was really just deleted or it was moved.
If this was implemented it would be easier to support watching
moved directories too.

I have worked out most of the internal workings of this part but
have yet to even start coding it. I thought I would get some
comments on this before I charge blindly in.

So has anybody got any comments, suggestions, better ideas etc ?
Any intelligent response will be gratefully received.
If this seems vaguely sensible to a few people or if nobody comes
up with any major problems I will go ahead and implement this
soon.

Thanks in advance,

Steve.

I guess a more general approach would be nicer.
For example, a 'motif-like' call-back mechanism:

"any" (well, some) mutable objects would come with a list of
callback functions: every one of those functions (in their respective
address space if you're lucky enough to have an MMU) will be called
whenever that object is modified.

To keep your window up-to-date, you would just ask MiNT to add a
callback on directory X to warn you of an update. (it's like a signal,
or a software exception)

It has the advantage of avoiding polling (=busy waiting).

Of course, I have no idea how easy it would be to specify a nice
interface and to implement it.

Stefan

PS: luckily the process swapping idea has been killed already, so that
all those function pointers wouldn't be a problem :-)

I'm wondering if it is worth the effort to add these features to a desktop or Mint. Are there any other desktops out there that register changes in realtime, updating windows with file lists as soon as changes occur?

I can see where this would be nice but it seems like a lot of effort to go to for a very minimal gain.

==========================================================================
TOWNS' LITTLE GUIDE TO REVISIONS - VERSION 1.0
------------------------------------------
Written by John Townsend, Atari Corporation
==========================================================================
This is a small document that explains in very terse terms the
differences between the TOS revisions available for ST/MEGA/STE/Mega
STE/TT machines, what patches are needed for what revisions, the formats
they are available in, and any notes I can think of.
I hope this will clear up some of the confusion with the different TOS
versions. If you have any questions on this document, please let me
know here on GEnie. My GEnie Address is: TOWNS.
Special thanks to Leonard Tramiel, Allan Pratt, and Doug Wheeler for
their involement with this little Document. Thanks again!
Comments are welcome..

-- John Townsend
Atari Corp.

ROM TOS (TOS 1.0)
-------
The original ROM TOS, this version shipped in 520ST and 1040ST machines.
It is no longer shipping in any machines.
Formats: 2 chip ROMs, 6 chip ROMs
Machines: 520ST, 1040ST
Utilities: FOLDRXXX.PRG
FOLDRXXX.PRG will add more entries into your OS Pool. In TOS 1.0 and
TOS 1.02, the limit for the number of directories that you can enter is
around 40. With this program you can extend that limit much higher. If
you are using a hard drive, this program is recommended highly. It will
work with all TOS versions and will improve the performance of your
system.

Notes: GET TOS 1.04 TODAY! TOS 1.04 is the latest version of TOS for
520/1040/MEGA owners. It is MUCH faster, has faster, better
disk I/O, many other improvements.
MEGA TOS (TOS 1.02)
--------
This is commonly referred to as MEGA TOS. This version of TOS fixes some
minor problems in TOS 1.0 and has support for the BLiTTER chip and Real-
Time Clock chip.

Formats: 2 chip ROMs, 6 chip ROMs
Machines: 520ST, 1040ST, Mega 2, Mega 4
Utilities: FOLDRXXX.PRG
```

FOLDRXXX.PRG is explained above.

Notes: See notes for TOS 1.0.. GET TOS 1.04 TODAY!

Rainbow TOS (TOS 1.04)

TOS 1.04 or Rainbow TOS, as it is commonly known is the latest version of TOS available for 520/1040/MEGA owners. It has been available as a dealer upgrade for awhile now. It has much more robust Disk I/O, Autorunning of GEM programs at boot up, a fix for the 40 folder limit, and much more. Most of all is it much faster than previous versions of the Operating System.

Formats: 2 chip ROMs, 6 chip ROMs (available as Upgrade!)
Machines: Stacy
Utilities: TOS14FIX.PRG, POOLFIX3.PRG, CACHEXXX.PRG, FOLDRXXX.PRG
TOS14FIX.PRG solves some small problems in the AES (for additional information, please see the documentation that accompanies the TOS14FIX.PRG program).
POOLFIX3.PRG fixes a bug in GEMDOS. Documentation that accompanies the POOLFIX3.PRG program explains (in detail) the problem that it fixes.

CACHEXXX.PRG is a new program that adds GEMDOS buffers to your system. The caching of data and disk directories by GEMDOS (when this program is used) will result in your system running much faster! This program is highly recommended and requires TOS 1.04 or higher for full benefits!
FOLDRXXX.PRG is explained above.
Notes: Please use the utilities available and if you haven't upgraded to this version of TOS yet.. please consider doing so. It's a very worthwhile upgrade.

There are some disk-based versions of _early_ developer only releases of TOS 1.04 floating around on BBS systems here in the United States and abroad. Please don't use them! They are bad news! They have some very nasty bugs and have been known to corrupt data!

STE TOS, Rev 1 (TOS 1.06)

TOS 1.06 is the TOS version that is shipped with the 1040STE and 520STE machines. It is essentially TOS 1.04 with support for the new hardware that the STE has.
Formats: 2 chip ROMs
Machines: 520STE, 1040STE
Utilities: STE_FIX.PRG, POOLFIX3.PRG, CACHEXXX.PRG, FOLDRXXX.PRG
STE_FIX fixes the infamous Desktop Medium/Low resolution bug. The problem is that there is a bug in the desktop code in this version of TOS that prevents the user from booting into Medium Resolution. The patch program STE_FIX will solve the problem. Once it is executed in the AUTO folder, the problem no longer exists.
FOLDRXXX.PRG, CACHEXXX.PRG, and POOLFIX3.PRG are explained above.
Notes: This version is only available in 1040STE and 520STE machines.

It isn't available for upgrading. It won't work in older
machines.

STE TOS, Rev 2 (TOS 1.62)

This is a slightly revised revision of TOS 1.6. It fixes the POOLFIX
problem in GEMDOS and the problem in the Desktop that was present in
TOS 1.06.
Formats: 2 chip ROMs
Machines: 520STE, 1040STE
Utilities: CACHEXXX.PRG, FOLDRXXX.PRG
CACHEXXX.PRG and FOLDRXXX.PRG are explained above.

Notes: This version is only available in 1040ST and 520STE machines.
It isn't available for upgrading.
Mega STE TOS (TOS 2.05) ---
TOS 2.05 is the version of TOS currently shipping in the Mega STE.
Formats: 2 chip ROMs
Machines: Mega STE
Utilities: CACHEXXX.PRG, FOLDRXXX.PRG
CACHEXXX.PRG and FOLDRXXX.PRG are explained above.
Notes: This version is only available in the Mega STE. It isn't
available for upgrading.
TT TOS (TOS 3.01) ---
TOS 3.01 is the version of TOS that originally shipped in the TT030.
Formats: 4 chip ROMs
Machines: TT030
Utilities: CACHEXXX.PRG, FOLDRXXX.PRG
CACHEXXX.PRG and FOLDRXXX.PRG are explained above.
Notes: This version is only avaible in the TT030. It isn't available
for upgrading.
TT TOS (TOS 3.05)

TOS 3.05 is the latest version of TOS currently shipping in the TT030.
Formats: 4 chip ROMs
Machines: TT030
Utilities: CACHEXXX.PRG, FOLDRXXX.PRG, SERPTCH1.PRG
CACHEXXX.PRG and FOLDRXXX.PRG are explained above.
Notes: This version is only avaible in the TT030. It isn't available
for upgrading.

Mfg,

Wilfred Kilwinger

5449. Hard Drives and ICD Link

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-16 11:35:49 UTC
From: vctec@westminster.ac.uk
Message-ID: <CGL1Jp.CyB@westminster.ac.uk>
Source record: 35898
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Dear Atari netters,

Please, please please help me.

I am now in the process of building my hard drive, and have bought ICD The Link.

Recently at a computer market, I bought a 85Mb Quantum ELS Prodrive. This did not work with the Link, as it was not recognised. However, an engineer told me that it was not recognised because parity on the drive had to be disables....which he did using ICD ADSCSI board. He did that, then the drive worked, the only problem being that there was some sticktion (is that the right word) on the drive, where when booted it clicked for a few seconds before whirring. I was told that the drive would just get worse until it just would not work.

I returned the drive to the person/company from whom I bought it, and got my money back. He did not have any more SCSI's in stock, but told me he'd find me on, and gave me my money back.

My question to you enlightened lot is what SCSI drives do I look out for that will work with the Link? (Model and number)

Which Drives definitely work with the Link? (Segate, Maxtor, Quantum, Conner)

Which drives have a parity on/off switch instaed of going through software?

How do I go about switching off parity if I get another one of these Quantums?

Anyone selling a cheap SCSI mechanism that will work with the Link? (at least 85 Mb, preferably 100, 3.5" 1" height or half height). I will go to a maximum of 120 UKpounds for a good sized drive. The last Quantum cost me 80 pounds!

Thanx for your help.

Dear Netters

Would someone point me in the right direction as to where I can find a patch program for the noisy internal and external floppy drives caused by TOS 2.06

Thanx in advance

Danny.

Emerson Emi (EMERSON_EMI@bdt.COM) wrote:
: I just got the Atari Compendium and I don't see any bios or
: gemdos commands to send SCSI read or SCSI write commands. I
: want to talk to a sampler, NOT a device that is not a mounted
: drive, so how do I go about this? Likewise no sectors are
: involved, just reading into a buffer, etc.. I'm not that fluent
: in SCSI theory and ID's however the device does not need a lot of
: different SCSI commands. Just SCSI READ and SCSI WRITE,
: basically. Without a BIOS level routine will it be necessary to
: write a routine for the ST(E) and then the TT SCSI and then
: Falcon SCSI, or even to the point of differnt versions for
: different ASCI to SCSI host adaptors?

SCSI - Small Computer Systems Interface - is not implemented on ST(E)'s,
we get instead ACSI - Atari Computer Systems Interface ;-). I know that
the Falcon has SCSI-2 (SCSI with a wider bus) but that's all I know 8-)
so the rest of this mail is about ST(E)...

Data transfer is taken care of by a DMA chip. However, this does not
handle the SCSI protocol (of which ACSI is a _subset_), it is purely
concerned with the transfer of data on the 8-bit bus.

The BIOS provides a function rwabs() and also lrwabs() for reading and
writing sectors on an ACSI device; lrwabs() is for "big" sectors! Now,
it is obviously not possible to build the hard disk driver software
(or for that matter DMA device driver software) into the BIOS (because
you couldn't possibly cater for all devices, ever), so what you do is
you provide vectors through which the BIOS makes a call when it want
to do things with hard disks:

o read BPB (BIOS Parameter Block)
o test media-changed flag
o read/write data

What happens is that "Hard Disk Driver" programs (for example AHDI.PRG
or ICD etc...) intercept these vectors and do the operations appropriate
for the specific drive (ie. Atari or ICD drive etc.)

If you want to have your sampler behave like a drive then what you have to do is intercept the vector for reading/writing data, then check which device it is, and if it is your sampler do the necessary transfers, otherwise jump to the "old" vector. There is something called XBRA for "stealing" vectors nicely, but I don't know anything about it!

Whatever happens, you will need to program the DMA chip to do transfers for you. In a single-tasking environment this is trivial (in fact there should be an example in "Internals" (Abacus) or the Dev.Docs (Atari)). You must ensure that it is not in use, then load the memory address for transfer, and the number of bytes etc.

SCSI is "daisy-chained", so each device passes the command onto the next - so your circuit would need to be quite complex if other devices are in use. I assume you can buy chips to do all of this for you (I'm a software person!:)

Let me know if you need any more help, all this is from memory, I've bound to have forgotten something!

.Ian.

5453. 2.5" hard disk on STE (IDE type)???

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-16 15:20:40 UTC
From: hallvart@ifi.uio.no
Message-ID: <2car48$t65@kolsaas.ifi.uio.no>
Source record: 35906

I've heard that you can now install 2.5" sized "IDE" type hard disks in any ST!
But the guys I talked to said it wouldn't work for the STE...But it should be
available for those too in a while.

Has anyone out there heard of this, and is it now possible to install it in an STE?
Any information would be helpful. Thanks.

Hallvard Tangeraas, Oslo, Norway

What are the SCSI addresses of the Quantum and SyQuest?

Sounds like you are having a conflict to me. I had a similar
problem when I added a second CD-Rom to my system without
setting the SCSI-ID from the factory default of zero.
Darned annoying, and I ended up trashing my boot sector.

Use the ICD utility IDCHECK.PRG to query all devices.

Brian

I think pl39 is on atari.archive.umich.edu:/atari/Mint/Lib...

> What's a good (and SMALL) version of MicroEmacs to get? Is there anything
> friendlier that I might want to try?

MicroEMACS 3.11 is on atari.archive.umich.edu:/atari/Editors (might be in an
Me directory). There's also JOVE and Mutt2...

> Can someone tell me about Curses? I mean specifically how to use them with
> TERMCAP strings and such so I can write software that can use any terminal
> type?

I think there should be some curses documentation laying around... I
got mine from the curses library for the OS/2 version of GNU C/C++.

> Is there a termcap based window library?

Yes, curses. :-) Oh, you meant a GEM windowing library... I hope to
start work on a GEM version of curses in the next couple of weeks, but
it might take a while (I don't have much spare time).

> My G++ library didn't have the delete function in it (the compiled form of

> a manual (bad assumption).

If you grab the G++ library source code (from any GNU ftp site), there's
a texinfo document describing the library in detail... If I remember, I
might upload a PostScript and an ASCII version to atari.archive (but

don't count on it... mind like a sieve!).

> Where are the GCC/G++ manuals? I want ASCII, how do I get it? Or, if ASCII
> is not available, how much hard disk space do I have to waste in other programs
> just to read some docs?

What do you want/need to know?

> Who is getting tired of all these stupid ass questions??

What about these stupid ass answers?

5457. GDB and debugging C++ programs

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-16 17:51:08 UTC
From: pareis@cs.tu-berlin.de
Message-ID: <2cb3ud$ekf@news.cs.tu-berlin.de>
Source record: 35909

Is there somebody who ever has tried to debug a C++ program
using gdb?

I did the following:

```
gcc -I../include -g -c teditor.cc
gcc -o teditor.prg teditor.o -lgem++ -lgem -lg++
gcc -B/d/gnu/bin/sym- -o teditor.sym teditor.o -lgem++ -lgem -lg++
```

and then

```
gdb teditor.prg teditor.sym
```

and I got this message from gdb (before gdb aborted):

```
Reading symbol data from /d/usr/src/gem++/test/teditor.sym
gdb: Internal error:
Unexpected debugging symbol type 'R' at symnum 8.
```

What's that?
(gdb runs correct without the sym file)

My gcc-ld and sym-ld are PL36, my gdb is V3.6 PL2 and I use MiNT 1.08

My understanding is that this is the responsibility of the program that installs the cookie. You check to see if there's a free cookie, if not you malloc some memory, relocate the cookie jar and update the sysvars.

I think it's too much work for the benefit of *a single program*!
Why don't you tell the author of UUCICO about the problem?
It should be fairly trivial to change UUWORK/UUCICO to create/expect
the UUCICO.PAR file somewhere else _first_ (possibly in \hermes or
in $HERMES).

Message-ID: <931117.06364.LMCCLURE@delphi.com>
Source record: 35914

I suspect your drive uses Supra's standard host adapter, which means the mechanism inside the drive chassis is a standard SCSI mech. What this means is that you don't need to add something on (i.e., a DMA to SCSI convertor), but rather, you need to bypass the host adapter (which is a SCSI to DMA convertor).

Of course, you'll need to find the proper cable to make the connection to the Falcon.

I know of no way to connect an IDE hard drive to an ST, although I have heard something about a cartridge based IDE interface. (Only the Falcon has built-in support for IDE drives, and is uses the 44-pin interface for 2.5" IDE drives).

You could use an ST-506 type drive by using an Adaptec or similar controller in conjuction with a SCSI-to-DMA host adapter, but it would not be very cost effective. Unless you happen upon such a setup cheap (such as an old Megafile 30 with the mech removed), I would not advise it.

There are companies that make external, ready-to go setups for the ST. Also, you could buy an ICD Link interface, and use most Mac external drives. (With the competition in the Mac market, at least here in the US, Mac external drives may be a better buy).

5464. Thinking about Cannon BJ-200's....Hmmm

I'm thinking on getting a Cannon BubbleJet 200 so I can put my old workhorse Panasonic KX-P1091i (9pin) out to pasture. I've heard good things about them before and just read the great review the BJ-200 received in the big review of printers in some PC (?something?) magazine.

If anyone has any experience with using a BJ-200 on an ST lemme know! :)

I'm wondering how easy it will be to find drivers for WordPerfect (and other PD Wordprocessors) Opus 2.31, PageStream 1.8, and other programs.

Also wondering about general impressions, specific problems, or other features that might be outstandind.

Thanks!

5465. SLM804 problems

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-17 07:07:05 UTC
From: ehood@convex.com
Message-ID: <1993Nov17.070705.5378@news.eng.convex.com>
Source record: 35916
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello,

I recently obtained a used SLM804 laser printer. However, when I power
it on, it nevers gets out of the wait/warmp-up mode. I believe I
have all the proper things in place:

- SLMC804 is hooked up to the DMA port and is ASCSI ID 7.
- Have the big serial cabll hooked up from the controler to
the laser printer.
- I boot up with the SLM804 Printer Emulator Disk.
- A message saying the diablo emulator is loading and that
it is loading TYP?????.FNT.
- The GEM desktop appears with the SETUP630.ACC loaded.
- The SETUP630.ACC gives "UNSPECIFIED ERROR" as the Status.

I initial had things booting from my hard disk, but the printer
never went into ready mode. Therefore, I tried everything from
floppy with the hard disk disconnected. I even waited way over the
2 minutes the manual said it would take to warm up before turning
on any other components. But nothing.

I'm not a laser printer expert, but shouldn't some of the parts in the
printer get hot, or is this only when it actual prints. Anyway, no
surfaces in the printer are getting warm. There is only a little heat
coming, from what I believe to be, the power supply.

I've checked the drum & paper chargers, and the wire is intact.

Any help is appreciated, and thanks ahead of time,

5466. Virtual Screen, GDOS & MEMORY.SYS

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-17 12:03:05 UTC
From: porret@elde1.epfl.ch
Message-ID: <1993Nov17.120305.1@elde1.epfl.ch>
Source record: 35923

I'd like to create a virtual screen with any resolution and bitplane number, to draw on it with standard VDI calls, and to save the result in a file or display a part of it in a window.

I recently bought SpeedoGDOS which includes a driver named MEMORY.SYS and I think that this driver could help me to do what I want to. I have no information at all about this driver.

Does anybody know :

- If this driver really allow me to do that.
- If it is a good solution to my problem.

If the answer is yes, how can I communicate with this driver with PureC ? (How can I set the resolution and bitplane number and fix the location in memory ?).

If the answer is no, is there an other way to do it (in a "compatible" way, whithout bad tricks depending on the machine) ?

Thank you for your answers.

I have one, and I _really_ like it. It's quiet, faster than a dot matrix,
and the print quality's very high, especially if you use laser paper.
: I'm wondering how easy it will be to find drivers for WordPerfect (and other PD
: Wordprocessors) Opus 2.31, PageStream 1.8, and other programs.
Well, you probably know that it emulates both the BJ-10 and the Epson LQ
510. You shouldn't have any trouble finding drivers for it. FontGDOS
includes a BJ-10 driver which works great, and you can use an Epson LQ
driver. The BJ driver is best for graphics, but if you're doing text
only, I would use Epson emulation.
: Also wondering about general impressions, specific problems, or other features
: that might be outstandind.
Overall, I like the printer very much. It's small, quiet, fast, etc.,
etc. About the only thing I don't like is that there are normally _63_
lines of text on a page, rather than the standard 66, so programs that do
text and graphics on the same page, or do fancy things with positioning
the printhead get screwed up unless you're careful.

The only OS I know of which uses this technique is OS-9.
And even there is the problem of function calls leaving ABSOLUTE
return addresses on the stack.

It's just that you don't have to care for initial relocation and
may use one program code image for many processes (shared code) if
a similar technique is used for data references.

: write a routine for the ST(E) and then the TT SCSI and then
: Falcon SCSI, or even to the point of differnt versions for
: different ASCI to SCSI host adaptors?

If you are using ICD's software get a copy of their file DMA.LZH from
GEnie. This contains a Pascal include file, and an object module that
you can use to send SCSI commands via either the ACSI or SCSI ports of
any ST/TT/Falcon computer.

This module is designed to be used with Personal Pascal. If you are using
Pure C, I can supply the C include files, and a module that changes the
stack frame from the Pure C to Personal Pascal stack frame for this module.

This is not available for GNU C/C++ because the GNU linker does not support
the same object module format as Personal Pascal and Pure C.

If you want an example of using this module there should be a copy of
the source of my program cdplayer.prg somewhere in the atari.archives.
If you can not find it email me, and I'll send it to you.

^^^^^^^^^^ ^^^^^^^^^

Interesting! Does this mean that the bus is unterminated, or is it that the Quantum is not the end of the chain?

I just added HD's to my 520ST. The enclosure has (3) 40MB Quantum drives. All went together fine except that I get write errors if I install termination packs in the last (or any) drive. So long as I leave it unterminated, all works fine. I know this is not the desired configuration so I am somewhat reluctant to move too much the the HD yet.

Just wondering if you had similar problems.

Thanx, Phil

Perhaps MInixfs pl9 (under construction) will help. I'm adding some of the functionality of mount(), though this stuff really belongs in the kernel. The current version (which only I have got) allows lots of drives (all Minixfs) to all be referenced as subdirectories of each other (well identical to Unix really.
Steve.

But, the US has a MUCH higher population (for example, about as many
people live in New York City as live in _Canada_)...

This is all speculation though... We'd have to ask Atari for real
figures and there's no way they'd ever tell us truthfully.

The dma hardware doesn't need a process to do busy waiting until the
operation returns. It would be nice if there were a mint only hard
disk driver that put procs to sleep during transfer.

I agree. Also, how "real-time" could the update be? What if I have
the files displayed with their sizes? Do those sizes also change as
the file has bytes appended to it???

5480. Help! Starting with Heat-n-Serve C!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-18 06:35:18 UTC
From: 01mbmccabe@leo.bsuvc.bsu.edu
Message-ID: <1993Nov18.013518.24939@bsu-ucs>
Source record: 35932
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am trying to get started learning C using HSC 1.44. This is the code for the first sample program:

```
/* Filename: c2first.c
Requests a name then prints it 5 times and rings a bell. */

#include <stdio.h>
#define BELL '\a'

main ()
{
int ctr=0;
char fname[20];
printf("What is your first name?");
scanf(" %s",fname);
while (cnt <5)
{
printf("%s\n", fname);
ctr++;
}
printf("%c",BELL);
return;
}
```

When I try to run the source through HCC.TTP I get this error:

```
"warning in D:\DATAFILE\CPRGS\C2FIRST.C (20): Function should return a value"
```

Can someone familiar with Heat-n-Serve (or who just plain knows :) give me some insight here?

BTW, sorry if the post is too long, but I don't really know who to direct E-mail to at this point. :)

Thanks for any and all help!

I need some help programming the new commands for the Falcon.

Before I venture into programming the DSP, I want to get the basics right.
At the mo I'm trying to connect up the microphone input and speaker using
the matrix and devconnect() (er... you know the command I mean!).

But, alas, no sound comes out.

I've tried setting the input gain, the monitor track and other things.

How do you do it ?

Please help. I'm a sad and desperate man !

Cheers,
Phil.

|> Unexpected debugging symbol type 'R' at symnum 8.

|> What's that?
|> (gdb runs correct without the sym file)

|> My gcc-ld and sym-ld are PL36, my gdb is V3.6 PL2 and I use MiNT 1.08

You should upgrade to gdb 3.6 PL4, available from ftp.germany.eu.net.
This should fix your problems. If not, please drop me a line.

The latest version shipped in the TT is 3.06. I think it includes some
bug fixes in the RS232 handling.

Note that FOLDRXXX is not needed any more for TOS >= 2.x (i think,
definitely not for TOS >= 3.x)

Wrong. (1) The ST Book, too, has internal IDE. (2) The IDE adapters that
are sold connect directly to the CPU.

5486. Re-compiling GCC / MiNTLIB 39

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-18 11:56:56 UTC
From: jdmt@dcs.ed.ac.uk
Message-ID: <CGorux.J63@dcs.ed.ac.uk>
Source record: 35939

Hi there,
a while back I posted an article asking how hard it would be to
compile gcc-2.5.x on my TT. I had quite a lot of helpful mail on the subject,
and my thanks goes to all those people who offered advice.
As most of them told me, compiling Gcc is really quite easy. The biggest
problem is however diskspace. For a start the compressed source for GCC is 6MB
long. This decompresses to a 24MB .tar file and then this needs to be un-tar-ed
, which requires another 24MB (as both the tar and its contents coexist on the
disk during the extraction process). Therefore if you want to compile GCC,you
will need at least 50MB of free space on your drive! You probably also need
quite a bit of RAM - I have 10MB but I guess 4MB would do. The third thing you
need is a fair bit of time.
Now that I have managed to compile GCC, my biggest problem will be keeping
up with the patchlevels - I got gcc-2.5.2 and 2.5.4 is out already! Now that's
what I call a real update policy!

I am also having problems compiling Mintlib.39 - I get a `function xxx
redefined in file included form ... " error a short way into the compilation,
and then make exits. Has anyone else had a similar problem trying to make 'top020'
- I am using GCC-2.5.2 , mintlib 36 and Mint 1.08? (If anyone is interested I will
try to get the exact error message for them.)

Hope you can help me again,
Cheers,
Joe.

This is exactly what ANY real ;-) multitasking OS does... Look at Unix, and even real time OS like VRTX or iRMX... That's the first thing that we learn here at school :-)... The problem is that for this, we MUST re-write the BIOS/XBIOS/GEMDOS to behave like this, and to become reen-trant... Then, any disk access will take 1% cpu time on a Hard Disk and... 0.01 % on a diskette (Waiting that the floppy spins, etc... I'm I wrong somewhere ?).

The only connection between the shifter and the disk drive should be the power supply. Checking the voltages across the various supplies (with an oscilloscope) would be a good place to start.

This make main implicitly int returning.

> {

[... Stuff deleted ...]

> return;
Huh? No return value?
> }

So I think it is just a C error, not specific to HsC. You could better
do "return 0;" return 0 exit code to parent process or "exit(0);" .

This might be a dumb question, but here goes - I have GNU Chess loaded and running happily on my 1040 ST - I notice the C source and Docs look like they are lacking your standard Tabs & Line Feeds at the appropriate places, so it looks "easy" to read..... I could write a text formatter program, but I was wondering what others have done in this case?
A long time ago, I remember seeing something about GNU files having to use Tex or some other utility to reformat source? If I have to use Tex, which version in the archives should I pick? Thanks for any advice on this. ----- Mike

> insight here?

If you don't specifiy what main() should return, it will be assumed it sends
back an int (to TOS in this case). Thus the 'return' statement should have
a number following it - 0 being the value TOS expects if the program
completes OK. To be correct your program should contain:

int main()
{

blah blah...

return 0;
}

Hope this helps.

Del

Hi Michael,

winters@access.digex.net (Michael Winters) writes:
>[...] - I notice the C source and Docs look like they
>are lacking your standard Tabs & Line Feeds at the appropriate
>places, so it looks "easy" to read.....

If you want to use the ATARI line-end encoding (Carriage Return/
Line Feed) there is a utility called `crlf.ttp'. It is included in
the MiNT library and does this kind of conversion stuff. I could
post you the source, it's pretty simple. By the way, it might be
copyrighted by entropy, so I have to take a look first.

The tabs are a real problem: do you want to have tabs at four or
at eight characters? I don't have such a tool.

>A long time ago, I remember seeing something about GNU files
>having to use Tex or some other utility to reformat source?

Most GNU software uses Texinfo documentation. Texinfo is a file
format that can be processed by TeX (actual version is 3.14) in
order to get high-quality printed documentation. Or it can be
converted into an info file, that is used for on-line information.
For the conversion into info file format you'll have to use the
texinfo software by GNU.
To view the info files you can use the texinfo package or the
GNU emacs.

From: pagan@meiko.co.uk
Message-ID: <2cgdsj$rto@bart.meiko.com>
Source record: 35846

Yup, me too. The monitor whistles and the screen moves to the left.
(This is on my SM124 by the way). The only cure I have found is to
clout the monitor on the side but I fear this will eventually
do more harm than good. It also only cures the whistle problem...
Must be a generic design flaw, and plain old age of course.

Also beware of using a TV (SCART-in) as a monitor and having the
ST Mono next to it as mine flips out completely after a few seconds.
The TV is running off by Fuel-Can, by the way.

DSP:
===
Is there anyone else out there who is trying to get to
grips with the DSP assembler language. I have just spent
the 50quid on getting myself the Atari DocSupport VI for
the Fuel-Can and so now have the assembler and debugger.
The DocSupport also has a lot of useful info (XBIOS calls
etc.) in it and I think was worth a mere 50 big ones.

SHARE INFO:
==========
What I might suggest is that people could post articles
in the st.tech section on any tips they have for programming
the F0x0. It is a brilliant machine afterall and it's about
time that the rest of the world knew this. Are there any other
Fuel-Can boffins out there working on stuff? Any tips to
share?

BETTER THAN PHONG SHADING:
=========================
I have, myself, a method of polygon shading which I think is
better than Phong. It's more accurate than Phong (P.S.cheats in
it's SLERP) and can be reduced to i = sRcos(a-b) where only
(a-b) varies...I am trying to figure out a way to do it
on the DSP at the moment (hence the Subject title).

Message-ID: <1993Nov18.222825.7297@ida.liu.se>
Source record: 35856

Hi all!
I'm writing a format utility for a computer that has the same floppy controller chip as the atari st (WD1772 that is). I would like to make it fast, at least more than one track each four disc revoulutions, which is what I've achieved now.

How do I do that?

I use the command "write track", but it seems impossible to make it write more often than every second disc revoulution. Is there any format utility for the atari st that is faster than that? I would really like to know if there is, because then I know that it is possible to do it.

Thanx! /Oskar (y91osken@und.ida.liu.se)

'main()' implies 'int main()' and you should use 'return 0;' instead of
'return;'

or

you could use 'void main()' in which case you use 'return;'

the 'void' before 'main' informs the compiler that this function does not
return a value and, IMO, should be used if the function is not returning
a value.

Best of luck with HSC, I use it occasionally and haven't come across any
problems with it (although I do not use it that much).

Well no not really. That's one *hard* way to do things. A better way is to
make the interrupt drive I/O accessible outside the nasty no reentrant stuff
and emulate the BIOS calls so pure non-TOS sections of code can run while
TOS is left hanging on the I/O completion. That way TOS could be kept happily
single thread while other things (Minixfs 1.0 perhaps :-) could take advantage.
However if my experiences of how awful some of the hard disk software
is with MInixfs is anything to go by, I wouldn't hold your breath (I'd do it
myself if persuaded and I had access to the hardware).
Steve.

Hear hear! This would be a great idea! In fact, maybe make the
buffer dynamically allocated so that you could do a cp -bnum source.file
dest.file where num is the maximum size of the buffer you would like to use
(constrained by the amount of memory available). This would have been really
nice the other day when I was messing with my partitions and throwing around
30MB of info around (I had started a 7MB cp before I relized what it was doing
to my nice new 210MB drive...:( ). Doing someting like the -bnum would be
good because then you could just alias your favorite buffer size:
alias cp "cp -b2024" /* num is bytes - this is for normal stuff. */
alias bcp "cp -b2024000" /* this is for those partition copies */

Anyone up to making what should be a relatively minor change to cp?

The monitor in question is the PS3000 monitor. It was a 13" color monitor with two disk drive bays. It had a card connector, rather than a pin connector, on the SS/DD drive so it was difficult to add a DS/DD drive. However, with a soldering iron, a cable, and a connector from Radio Shack I did it in an hour or so.

Keep coming to the meetings, and you may get to see one in person .... mine.

5506. SCSI 2.88 meg drives

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-19 05:00:11 UTC
From: fdomingu@zeus
Message-ID: <CGq38C.EL8@watserv1.uwaterloo.ca>
Source record: 35857

Does anyone know if I can install a 2.88 meg SCSI disk drive on an ICD host adapter and read high density PC formatted disks (1.44)? In the case that I can, what software would be recommended to format disks/read them in the case that I can't simply read the PC formatted disks?

fdomingu@zeus.uwaterloo.ca

>Has anyone ever run out of cookie jar space? I haven't, but I've seen
>a program called JARXXX that seems to be like FOLDERXXX (which I have never
>used nor needed, TOS 1.62).

That, or a program like it with the same name :-(is part of Neodesk
3.03, and it may or may not be freely distributable (JARXXX that is,
not Neodesk)

JARXXX adds a new xbios call (function number = "CJ") to enquire or
add cookies.

There /ought/ to be an OS call to do this sort of thing, IMHO. This
would neatly solve all the problems.

5508. BLITTER questions

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-19 11:40:33 UTC
From: laplai_c@anion.epita.fr
Message-ID: <2cibbh$598@boson.epita.fr>
Source record: 35861

Hi, I am just trying to use the BLITTER in one of my program,
but i seem to have a problem. I made a 68030 program witch allows
to scroll the true color screen in 320*200 mode.
I tried to do it with the BLITTER (thinking it will be faster)
but the problem is that it seems to be as slow as the 68030 version.

So my question is : is it normal ?

A friend of mine told me that it could be the VIDEL interruptions
coming so often, so the BLITTER can't work properly.
I'd like o notice that, when I use the BLITTER, the 68030 is NOT running
(bit 6 = 1 in $FFFF8A3D if i remember well).
Thank you in advance for reading and answering.

Another use would be when cutting/copying stuff to the AES clipboard.
It would be *very* useful to be able to disable (for example) the
Paste command if nothing is available from the clipboard directory.
Whether this should be an AES message or a MiNT signal could be
further discussed, but I feel it would be useful.

yes.
alas..you cannot run the blitter and the CPU at the same time..

The atari blitter is just fine to clear/fill some bitplanes, but in the others uses, the CPU is working as fast (and even faster in several cases). Of cource it may be easier to to it with the blitter.
Now, the Falcon030 blitter seems to me it has been optimized in some special cases (for example: OR will be much faster than XOR with the Falcon Blitter althought all modes were running at the same speed in previous Blitters).

But now if you want to scroll the whole screen try the hardware scrolling..

THE STUART A. LYSTER PI CALCULATION FOUNDATION

Prize of $20 Canadian.

To the programmer of the TOS 1.4 compatible (Atari ST OS) which
calculates the decimal expansion of PI, no more than 10% slower
than Stephan Olbrich's PI4.TOS, but which calculates to the RAM
capacity (or preferably beyond) of the computer (ie. rather than to a
limit upon arrays).

Times must be within 10% (or better) of Stephan Olbrich's standard:

100 decimal digits - .24 seconds
1000 decimal digits - 16.29 seconds
10000 decimal digits - 25 min 54.3 seconds

Doubling the requested number of decimal digits seems to quadruple the
required time, so, the times for larger #'s are accordingly;

25,000 - 2 hr 35 min 23.83 (est.)
100,000 - 10 hr 20 min (est.)
1,000,000 - 8 days 4 hours (est.)

(BTW - this is using the Machin arctan series. Using the Borwein &
Borwein quartically converging algorithm *will* yield far superior
results.)

Output must be made available to either screen or to disk.

Programs must be in my hands (by e-mail or by post) no later than
January 31, 1994.

Greetings, Gentlemen.

I have a TT with a harddisk filled nearly to the top and I want to
add a larger ~500MB harddisk and a tape drive for backup purpose.
I'd like to attach these to the TT's SCSI port. Can I just go out
and buy one of these units that MACs use and plug it in the SCSI
port in the TT's back? Will Atari's boot software be sufficient
to work with the HD and the tape?

I'm wondering if it is worth the effort to add these features to a
desktop or Mint. Are there any other desktops out there that register
changes in realtime, updating windows with file lists as soon as
changes occur?

I can see where this would be nice but it seems like a lot of effort
to go to for a very minimal gain.

--
---> Kendall Gelner (kendall@rice.edu)
========================

Agreed, it just isn't worth it! It seems like there would a CPU slowdown
from all the changes when it would be easier to just hit ESC if you think
the directory has changed. And any time you change directories it will be
re-read anyway, so its no big deal.

BTW, how do you like rice? I'm thinking of trying to get in there,

Apologies if this is a "stupid-question-everyone-knows-the-answer-to"(tm)
but can someone elighten me (more than the docs do) on what the
appropriate use of the GCC -mshort flag.

I realise that it causes ints to be 16 bits and causes use of the
*16.olb libraries, but when do I want this? Does it depend on the
architecture I'm using (STe vs. TT vs. Falcon)? What, if any,
relationship is there between using -mshort and MiNT?

>2.5" IDE drives).

Hard&Soft, Germany, developped (and sells) a TOS 2.06 TEC board with IDE interface compatible to the one in ST-Book. Works fine - we got one installed in an ancient 520 ST (dated July 1985) with a Conner 2024 internal drive.

That's for STs. For STEs, TOS 2.06 fits right in, and no IDE interface yet.

Note that TOS 2.06 or 4.0x and at least AHDI 5.00 are needed for IDE support.

bye, Peter

I mean something that would help in porting a GEM application to a TermCap
TOS-based application. Actually, a GEM version of curses also sounds good.
But it would be nice to able to create a Termcap version of a GEM program
without TOO much trouble, that way you could port a GEM application to
DOS or Un*x without too much trouble. You could character graphics and
line drawing symbols for the widows, the menu bar would just be text like
a DOS app, etc. Is it possible?

That's what puzzled me. It said that the built-in delete function was not
found. Come to find out, delete is really a small function that calls mfree()!
Not exactly the most efficient way (function calling a function), especially
since I don't think a library function can be inline, can it?

Here is your first error. Should be ctr, not cnt, you should also
think of using a for() loop, or while (ctr++ < 5) .

> {
> printf("%s\n", fname);

>"warning in D:\DATAFILE\CPRGS\C2FIRST.C (20): Function should return a value"
>-----------------------------------------------------

You need to return a value, just like it says. When you declare "main()",
what you are really saying is "int main (void)" <>. Anyway, you
must either make main explicitly not return a value (which may be more
efficient when you don't need a return value, as above) by using
void main() {
or you can specify a return value for main to return and keep main the way
it is. You would do this, like so :
return 0;
}
```

Take your pick. Either returning a value, like you declared for main (anytime you have a function and don't specify a return type, the return type is int). Or, you make main() return void. Returning void may not work for all compilers so I would suggest you leave main the way it is and replace :
return;
with the following code;
return exit(0);
This makes sure the compiler sees a return statement, and also calls the standard exit() routine to do cleanup, and it works with compilers that don't like you returning 'void' from main.

>Can someone familiar with Heat-n-Serve (or who just plain knows :) give me some
>insight here?

Look through the .S files that came with HSC. You should notice that one of the files contains a comment that says something like "the following is self modifying code, do not mess with it". Self-modifying code has been a nasty thing for quite some time. I suggest that switch compilers before releasing large projects. Self-modifying code may break on just about any CPU with a cache, but I'm not exactly sure (MegaSTE, TT, Falcon, AdSpeed).

Good luck.

5524. MEMORY.SYS

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-20 22:44:42 UTC
From: evanlang@sdf.lonestar.org
Message-ID: <CGtB6K.H6q@sdf.lonestar.org>
Source record: 35747

```
====================================
I recently bought SpeedoGDOS which includes a driver named MEMORY.SYS and I
think that this driver could help me to do what I want to. I have no
information at all about this driver.

Does anybody know :

- If this driver really allow me to do that.
- If it is a good solution to my problem.

If the answer is yes, how can I communicate with this driver with PureC ?
(How can I set the resolution and bitplane number and fix the location in
memory ?).

If the answer is no, is there an other way to do it (in a "compatible" way,
whithout bad tricks depending on the machine) ?

Thank you for your answers.
====================================

MEMORY.SYS is really your only solution if you wish to use VDI calls.
If you want to do the graphics yourself, without VDI, then you can just
malloc() some space and then use vro_cpyfm() to bit-blit from your
buffer to the screen.

To use MEMORY.SYS, install it in your assign.sys file. I think the
standard is to use workstation 61 for it. Also assign fonts there.
MEMORY.SYS is a set resolution, the same as a 9-pin printer. Its
also monochrome like a 9-pin printer. However, what you can do is
is to kludge it legally and still work with graphics cards.

I wanted to create a graphical terminal emulation (like IGS, only in
a window and about 4 times faster with more features), and I had the
problem of redraws. If a user scrolled the window I would have to redraw
a 10-100 VDI commands on a small portion of the window for every
line advanced. This was not acceptable, so I needed to use VDI to
a memory buffer and then bit-blit it, with vro-cpyfm to the window for
all redraws. However, like you I need color, so!

Allocate a buffer equal to horz.res x vert.res x bit.planes / 8. Put
this on a 16 byte boundary for faster access (you may want to put it
on a 256 byte boundary if you want to page-flip to it ever on a stock
ST, I don't recommend that). Now, you can't write to this screen,
but you have a pointer to it, and you can define a MFDB from that to
use with vro_cpyfm(). Now, open a physical workstation to memory.sys.
You just use v_opnwk(), not v_opnvwk() !!, and then try and load any
fonts. You can get the resolution of this screen from the work_out
```

array. You only need part of the screen, ignore the rest, unless the physical screen is larger (then you are out of luck). You may be able to open this in NDC mode.

Now, you write to the memory.sys screen with the VDI, since you have a handle for it. And then you use vrt_cpyfm(), a mono version of vro_cpyfm() that will blit from your mono screen to the one you malloc'd and will add color as it does so. Be sure you use OR mode to do this. Using the example of the graphical terminal, I would get graphics comands from the modem and perform the VDI calls, every so often (long timer event) and when the color is changed to a new one, I would have to blit the mono screen to the color one, with vrt_cpyfm, clear the mono screen, and then use vro_cpyfm() to blit the full color screen to the window (while walking rectangles).

Its either this way, or risk incompatibilty with 1/4 to 1/2 the ATARI line or you can get docs from ATARI (and sign a NDA) and write your own VDI driver to handle off-screen VDI calls. I would kill for a driver that just makes a new screen in memory, the same as the current screen. I think you have to use printer fonts for the memory.sys driver, but try screen fonts anyway, and see if they work.

I have NEVER implemented this or even tried. I'm saving for later just in case someone writes that multicolor VDI driver, then again, we don't even have a damn postscript driver!!

You should be using a new version of Diamond Edge. Version 1.10 will create
individual lostclus files for each retrievable FAT string (GREAT job Bob!).
Also, 1.10 looks fabulous on the Falcon!

5526. How can I tell if a floppy is in the drive? (from C)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-21 09:24:29 UTC
From: wilsont@rahul.net
Message-ID: <CGu4st.Bow@rahul.net>
Source record: 35875

Hello Netters

I'd like to make my own "No floppy in drive" error handling, cuz right now
a floppy "not responding" alert box comes up, and there's no mouse
cursor. (its a rez-changing program, AES is kinda screwed up by it)

I'm guessing I'm gonna have to program on the bare metal and screw
with the hardware registers. but before I waste time i'm asking
for a solution from the net.

Is this in the Atari dev docs? if so where?
any sources floating around to do this?

Thanks for Your help!

Folks,
I'm an ex. ST owner (STM + TOS on disc etc) and would welcome any
help with this small problem. I need the file formats for the following
packages:

Degas Elite : PI1 and PC1 (urgently)
Spectrum 512: All of them.

I need to access these pics on my Arc, I'm happy to write my own
apps to do this - I just need the details. I'm sure this is FAQ or myth&lore
stuff, but I can't find it anywhere.
Hope you don't mind a non-believer asking in this sig.
Any pointers should be sent to:

gpcec@sun.pcl.ac.uk

Thanx in advance. Just trying to be, Tom.

>* |____| * run in circles, scream and shout."
>* * Disclaimer: I do not speak for Meiko...Only for God

Atari mono monitors have had a history of problems.

Most of the monitors at my secondary school developed the same fault:

The monitor works normally most of the time.
Several hours into the session, the monitor suddenly changes the size of the screen. (same picture, but smaller)
It may go back to the normal size over a few seconds, or it may suddenly go back after several minutes.
This will repeat, say, 1/2 hour later.

My mono monitor has this fault:

The screen works normally except when the total amount of 'white space' on the screen goes below a certain threshold.
Then the screen gets dimmer and dimmer, until it goes black, as if somebody had turned down the brightness.

The threshold is very low : you get to it by changing the screen colours to white-on-black and having less than 10 characters or so on the screen.

Has anybody else found this?

Peter Benie

Message-ID: <2co3q2$912@terminator.rs.itd.umich.edu>
Source record: 35880
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

In response to the recent talk of the mint-mailing list. There
is such a list which has been established for those involved
with improvements and additions to the MiNT kernal and related
software. It is *not* a MiNT help line for beginning users to
ask questions. That is best left here, in comp.sys.atari.st.

If you feel that you would like to be added to this mailing list, please
send me mail. I typically don't read any news that doesn't have the
words atari.archive in the subject, so posts will most likely be
ignored.

In addition, there is a list for people directly involved with
ip additions for MiNT. I do not maintain this list, but will forward
requests to its maintainter.

Cheers,

Together with a 520 w/o disk drive that would be a MAC look-alike :-)
And if you had a 520 STF or a 1040 STF you would get to disk-drives..
Quite handy if you ask me ?

In principle, yes. IF you set ID's etc correct and IF termination is
correct and IF you have the correct HD driver, your TT chould recognize the
external devices (mine does).

The HD (when formatted an partionized) should work straight on from TOS.
to use the tape streamer you need extra SW. Like GEMAR. It is available at
severeal ftp sites.

Marcel.

The port is acording to my information exactly the same as the MAC one
and the HD should work ok, but I think you'll have to expect software
problems with the tape. Correct me if I'm wrong.

5540. RE: Blitter Problem

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-22 12:05:22 UTC
From: BACH@EZINFO.VMSMAIL.ETHZ.CH
Message-ID: <CGw6x0.7GB@bernina.ethz.ch>
Source record: 35885

: Hi, I am just trying to use the BLITTER in one of my program,
: but i seem to have a problem. I made a 68030 program witch allows
: to scroll the true color screen in 320*200 mode.
: I tried to do it with the BLITTER (thinking it will be faster)
: but the problem is that it seems to be as slow as the 68030 version.

: So my question is : is it normal ?

YES, The Blitter is actually NOT very fast for True Color Modes.
Since you can access every single pixel directly (i.e. one word=one pixel),
it won't speed up too much. The Blitter gains its speed when you are
transfering from an x-value where x MOD 16 =/=0 to a x2 that has
a different modulo (x mod 16=/=x2 mod 16).
While copying, you'll have to rotate the pixels. And here, the M68030
is NOT very fast.

: A friend of mine told me that it could be the VIDEL interruptions
: coming so often, so the BLITTER can't work properly.
: I'd like o notice that, when I use the BLITTER, the 68030 is NOT running
: (bit 6 = 1 in $FFFF8A3D if i remember well).
: Thank you in advance for reading and answering.

Since ATARI forgot to add **REAL** Blitter-DMA into its computers,
is there no way for you to speed things up.
So you'll better copy with M68k and tons of MOVEM.L's :)

My hard drive keeps giving me a sense code of 11. I have a ICD advantage + adaptor with a 50mb hard drive. The hard drive boots but refuses to continue loading my TSRs. It gives a sese code of 11 (invalid address (?)). My question is, is this hard drive toast? Should I buy a new one or should I just reformat it? Please respond via email. Thanks!

I really hate to be the bearer of bad news...

Sense Code 11 means quite a few things
Unrecoveraable error is what it basically turns into.
Also read retries exceeded

I would get a copy of ICD's cleanup, on floppy obviously, and run it
against your HD, and see if it can recover your drive.

Hmmm, no. (1) Hard&Soft ships their own driver with the cards and (2)
if you don't have TOS 2.06, you just loose the ability to auto boot.
You can still load the driver from an ACSI hard disk or from floppy.

Hi !
I hope you can help me in this painful :) mem exp.

My system is old 520 STM with german 1/2 meg ram expansion card installed.
Card has four mem socketed chips. I don't know what kind of chips they are
(size?). So question is: can I increase my system main memory by only
replacing the old chips with ones (more capacity). E.g. I think that these
chips are one megs so is this possible to replace them with four megs.
I think there might be some brobs with resistors and stuff, but will you
enlighten me (I'm not really with this hardware hacking).

Please reply via email, I will post the results.

Thanks in advance!

Ville

|> alias cp "cp -b2024" /* num is bytes - this is for normal stuff. */
|> alias bcp "cp -b2024000" /* this is for those partition copies */

Remember that while reading from or writing to the disc, that is while
the hd driver is waiting for the drive, no process switch can occur,
thus all processes will be blocked. So i don't think that such a big
buffer, especially if cp runs in background, will be a Good Thing.
You'll have to wait for interrupt driven I/O before this will be
usable :-(.

Hi,

Has anyone out there managed to get EGEM (Enhanced GEM - windowed dialogs, popup menus, cycling widgets) working with Lattice C v5.x ? I've tried compiling it but can't get anywhere with it at all. Also it doesn't help having all the documentation in German!

So can anyone either tell me what to do, or mail me .O file and whatever else I need ?

Many thanks

Ian

Source record: 35806
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've had my Falcon for a few months now but I'm still suffereing from a really annoying little bug in NewDesk...
This is the problem: I set all my keyboard shortcuts up how I like em, save the NEWDESK.INF file. No prob... I now run another program (any program) and when I come back all the keyboard shortcuts are screwed up. From saving the desktop again I've sussed that another copy of the NEWDESK.INF line dealing with keys gets appended to the existing one... this really is annoying since quite often I'll have been running a program and then I'll say add another installed application, if I then saved the desktop I'd get garbled keys in the NEWDESK.INF file and would then have to attack it with an editor...

So does anyone else suffer from this ? Is there a cure, should I get in contact with Atari about it ?

Cheers

Ian

(my system is Falcon 4/120 with TOS4.04, nVDI and screenblaster)

I got rid of my BJ10e due to compatability problems - Epson LQ emulation
will cover you for just about everything, but only BJ10e mode makes
the most of the printer. Hence I found myself twiddling with dip
switches far too often and went for a Deskjet instead.

For AES 4.0 and up (MultiTOS, that is), Atari defined an AES message to be
broadcast to all applications, indicating that a certain directory's
contents have changed. Programs with heavy file creation/deletion
activity, e.g. archiver programs, should use this message.

bye, Peter

Change "return;" to "return 0;", or just delete it. Unless you
(incorrectly) define main() as:

void main( void )

return needs a value.

5566. HARD DRIVE TROUBLES!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-24 05:25:35 UTC
From: bili6745@mach1.wlu.ca
Message-ID: <CGzDqp.F5E@mach1.wlu.ca>
Source record: 35814

Well I'm having some big hard drive problems and i"m hoping somone can help.

I just got a SEAGATE ST4144R used hard drive that works fine.

Currently I have a ICD HA (with clock) and a ADAPTEC rll controller.
My drives are Mistsubishi MR535-UOO and a PTI 357R.

I took out the PTI drive and put in the SEAGATE. The system still booted
off of the Mitsubishi but the ICD pro (6.08) utilieties gave a $03 error
when i tried to format the drive.

NOW my Mitsubishi wont boot or be recognized on the other then being in the
location 0,0 (ie, no partions) I took out the SEAGATE and put the PTI drive
back in. ICDBOOT will recognize the PTI drive but not the Mitsubishi.

It is very important i get back into my mitsubishi drive (as well as getting
the seagate operating). Anyone who can help in any way would be greatly
appreciated. *I would be forever in your debt*

Keith

>good because then you could just alias your favorite buffer size:
>alias cp "cp -b2024" /* num is bytes - this is for normal stuff. */
>alias bcp "cp -b2024000" /* this is for those partition copies */

I recall browsing though some of the source for cp which dynamically
selected the buffer. It would start by attempting to malloc() a buffer
the size of the entire file. If this failed, it would ask for half as much,
if that failed, it would ask for half of the previous request...etc.

For example, to copy a 100,000 byte file, it would ask for a 100,000 byte
buffer. If that failed, it would ask for a 50,000 byte buffer. If that
failed, it would try for a 25,000 byte buffer.

So, if you have the memory, it'll get used. If you don't, it won't.

Unfortunately, I can't remember where I saw this code.

I am looking forward to buy a second HD, too. I have gotten one thing straight so far and this is that you won't have to use a MAC HD or a MAC cable but you can use an AMIGA HD and an AMIGA link instead (the MAC compatible version, of course).
The only difference is the price. An apple shop offered a cable for DM 60,- and an amiga shop for DM 30,- :).

Good luck with your drive.

That's theoretically right, but if you consider that you can speed up the
cp by more than 10 times, you might very well like this as a temporary
patch :-)

Not so hasty... I had a pile of "Sense 11" errors when my HD power supply was a bit dicky. I replaced the PSU (for 15 quid), backed up what I could (which was all but two files) and reformatted. No problems ever since.
BTW this is a Seagate 48Meg SCSI drive using ICD utils and drivers of unknown version number (ie I can't remember).

I don't know it myself, but I know the structure of GDOS drivers is described in the Profibuch. The Profibuch authors refer to the developers docs, I think. They even write that templates for GDOS drivers are available to developers from a mailbox operated by Atari, the developers only need to provide the code for the driver functions.

Should work without problems. All my peripherals (an internal 425MB Quantum, an 88MB SyQuest + a CD-ROM reader) come from Mac dealers or are products specified "for use with Apple Macintosh".

> The HD (when formatted an partionized) should work straight on from TOS.
>to use the tape streamer you need extra SW. Like GEMAR. It is available at
>severeal ftp sites.

Hopefully we'll receive our DAT streamer this week so that I can test it with my TT and GEMAR 2.01 (or whatever it was). This latest version also comes with an XFS which makes the streamer a Read Only drive. Sounds promising. The reason why I'm mentioning this, is that a lot of companies are emptying their warehouses of old 1.3 and 2.0GB DAT streamers which are "dead" on the market. Check out comp.peripherals.scsi - they have been mentioning prices as low as $350! Something to grow with...

Source record: 35828

>For example, to copy a 100,000 byte file, it would ask for a 100,000 byte
>buffer. If that failed, it would ask for a 50,000 byte buffer. If that
>failed, it would try for a 25,000 byte buffer.

Even the smallest of these values would speed up the performance heavily on the
st (compared to gnu cp).

Would it help to recompile gnu cp with

#undef BUFSIZ /* supplied in stdio.h in hp/ux */
#define BUFSIZ 32768 /* or some other value */

??

Why doesn't someone write a simple cp from scratch? The functionality of gulam's
cp would be enough for 99.9% of the users --- and for the few situations where a
simple cp (which must be able to copy directory trees between two
partitions) is not sufficient, no one is prevented to use gnu cp.
I think most of the elements needed can be taken from K&R.

Another problem is mv. My version bombs when it has to copy multiple file,
especially when the target directory is given by a symbolic link.

But isn't mint already somewhat reentrant? Other processes can run
while you wait for pipe or terminal reads to return, why can't the
same be true for disks? The dma device driver might need to create a
que of procs waiting for io, but this doesn't seem to imply a complete
rewrite of mint.

I had a similar problem on my TT. I never fully diagnosed it though - I just
went back to a bare NEWDESK.INF and hacked at it again. The problem seems
to arrise when you start fiddling with your own additions (I was adding
a handler for "*"-type files).

One thing to be careful of: make sure you have CR-LF's at the end of
lines, not just LF's.

I too have problems loading ACCs with MiNT (but not MultiTOS) present.
One thing that _always_ causes MiNT to crash (and thus, a reboot), is
Xcontrol, even if nothing else is loaded... none of my CPXs are
resident, either.

Right now I can get the BeforeDawn ACC and TOSWIN to load. That's about
it. :-(

My disk (a Quantum-Q250) isn't particularly fast (~25 or 28ms access),
and neither is my ST.

You can easily realize this by patching the getxattr() call in tosfs.c
so that it masks out the "other user" bits. On my TOS partitions files
look like "rwxrwx---"... :-)

On a similar topic, has anyone noticed that if you miss off the
destination in gulam's cp, then it bombs??
If you do this in Mupfel (Gemini) then you get a usage screen
which appears more user friendly.

Just a stupid question, when you have your TOS 2.06 installed, have you
taken out all the other TOS-ROMs??

Are you really sure that your monitor does make these phenomenes?? Try
your monitor on another ST. If it changes color when the ST is accessing
to the disk drive, it might have something to do with the shifter or some
elements around him.

almanak@student.AenF.wau.nl

Hai,

I'm searching for a neat PRINTERDRIVER for my ATARI 1040 STf to print on a START LC-10 from the program FIRST WORD. I have made my own driver but that isn't printing the super- and subscripts very well (eventually very bad).

My question is of anyone can give me an advice about a certain driver or even sent one over the mail (if possible). If anyone can help I would be very pleased.

Greetings from Roel.

5598. Reentrant AES calls

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-25 17:49:03 UTC
From: fountad@vax.sbu.ac.uk
Message-ID: <1993Nov25.174903.4004@vax.sbu.ac.uk>
Source record: 35749

How is it possible to do the impossible and make a reentrant call to the AES? It can be done - just have a look at any replacement file selector. They all use GEM objects from within the fsel call.

I disassembled the LGS and found some odd looking routines that appeared to emulate a trap #2. Perhaps the real question here is, why cant I make a reentrant AES call? I thought it was something to do with the stacks but what I never found out.

Del

5600. Re: HARD DRIVE TROUBLES!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-25 22:32:00 UTC
From: bo_leuf@daggskim.ct.se
Message-ID: <2cf537a4@daggskim.ct.se>
Source record: 35754

Some thoughts on possible causes of your misfortunes...

I've seen something similar happen in two different ways:

1. Adding a used MF30 as unit 1 behind a MF60. Reads were ok, but any writes trashed files and FATs, usually rendering a partition unreadable, sometimes making either or both drives unbootable. I experimented and tried this several times after restoring partiton tables and wiping offending partitions (needless to say none of the data was irreplaceable). My only conclusion was that the offending MF30 somehow overloaded the DMA-bus (possibly the MF60 DMA chip is below spec).

2. Incorrect termination on SCSI-bus with more than one unit. Again, reads were fine, but writes really messed up the data.

Another possible might be having had more than one drive with the same ID#.

Anyway, at a guess your Mitsubishi partition table and sector 0 info has been corrupted, whatever the exact cause. If so, and your're real lucky (know or can guess the right sector numbers), you might with a diskeditor or SCSI-editor be able to restore at least the partition values and thus access the partitions again. The first partition is easiest, it always starts at the beginning :-) . Some utilities (ICD cleanup) can make educated guesses about where partitions begin, but you may have to totally zero the partition table (entire sector 0) first if there is garbage there.

It is sort of publicly available - for developers.
The copy of speedo-gdos sent out to developers did come with application
skeletons for gdos-drivers. Both colo(u)r and monochrome.

>Why doesn't someone write a simple cp from scratch?

Huh? GNU CP isn't slow because of its functionality. It's slow because
the MiNT library suggests a very low buffering size for the sake of
keeping task switching high. Simply changing that buffer size is all
that is required.

Rewriting these utilities would be a total waste of time. Not to mention
that it would be annoying, since some people DO use advanced the features
of cp.

How does one add new desktop icons so that they are recognized by TOS.
When I upgraded to TOS 2.06 on my Mega 4 ST there was an icon file
that came with it (from Oregon Research Assoc.), but I never could
find any docs which stated how to install these icons.

Maybe I'm dense, but I would appreciate any suggestions.

From: evanlang@sdf.lonestar.org
Message-ID: <CH3AHJ.D9L@sdf.lonestar.org>
Source record: 35788

==========
will handle the 70Hz vertical sync required for the atari's mono mode and has ho

rizontal syncs of 31.5 and 35-38kHz. Anyone done this ? Can anyone give me the
pin connections please?

i==========

Well, that's 72Hz, not 70Hz. (Multiply 480x60 and divide by 400 and you get
the new refresh rate for the same bandwidth, 400 and 480 and the number
of scan lines for the ATARI and the 60Hz VGA).

31.5 is correct. It's exactly twice the 15.75 or whatever scan rate of Color.
I'm using an NEC 3D. Y ou will have to find out the pin-outs for your
monitor (VGA is 9 pin, SVGA is 15 pin). Just connect the V-Syncs together
(the ATARI pin-outs are in your manual), and the Hsyncs together. Connect
ST mono out to the RGB inputs of the monitor (they get tied together). Also
tie the ground lines together and tie the the STs mono detect to ground.

If you see smearing, like a green smear or something, Just turn down the
contrast on your monitor (never run the contrast full blast like the PC
users do, the ST seems to have a higher signal strength).

It works for me.

>====================================

It only allows monochrome bitmaps. I don't know how to set the
resolution (etc) though, but it might be documented in the Compendium.

As an alternative, if you have NVDI 2.5 or greater, use the NVDI
off-screen bitmap functions that work in all VDI modes (even TC) and
are very flexible (malloc your own memory, or let the VDI malloc it
for you). They'll use Speedo fonts too. I know this isn't a brilliant
solution, but it'll do the trick until you get docs for memory.sys.

ST World once reported that Atari never publicly released the GDOS
driver details to stop the flood of "poorly written drivers". So now
we have the situation of having 'well-written' drivers, but only 6 of
them.

That is completely true. But there are some problems with that as the normal
hard disk interface does NOT use a scsi device driver. Instead it just uses
the non-mint-aware hd driver which comes in before mint. And even the GEMDOS
is not reentrant, so there have to be preparations for that case, as nobody
has done a TOSfs as an xfs.
But luckily some people are working on such a scsi device driver which can be
made interrupt driven easily as soon as mint make sure that the GEMDOS is not
calles twice at the same time.

Ulrich

Are these docs available to the public yet? This is extremely interesting
for the GEM clipboard in particular. (For now if you want to continuously
display the contents of SCRAP.TXT the only option is periodic checking).

This comment is just a joke. If you look closer you will notice that
this assembles into some nice text to identify the library. There is
nothing that modifies this at runtime, and it is never executed.

>but what I never found out.
>
That is clear, if you understand how all this works together: the fsel box
is in the trap handler chain in front of the original AES trap handler and
waits there for calls for the file selector. All other calls just go through
the fsel's trap handler (even it takes some more time). If the fsel does now
internally a call to some AES function (note: not the fsel functions, that is
important!) it might go again through the trap and its own trap handler, but
this time the call goes through to the original AES handler, so the AES is now
called really. But it is known that the AES is NOT reentrant, so it is a bad
idea to call the AES from inside itself, but that can under a single tasking OS
only happen if you do that within the drawing function of a userdef object, and
there it is explicitly forbidden.

Under a multitasking AES the implementor should have taken that into account
and should have programmed some code that is either reentrant (all the objc_
functions that do not access the screen as example) or prevent the functions
from being called twice.

Regards,
Ulrich

5613. PRINTERDRIVER

Summary: Searching for...
Keywords: STAR LC-10
Date: Thu, 25 Nov 1993 16:15:25 GMT

almanak@student.AenF.wau.nl

Hai,

I'm searching for a neat PRINTERDRIVER for my ATARI 1040 STf to print on a START LC-10 from the program FIRST WORD. I have made my own driver but that isn't printing the super- and subscripts very well (eventually very bad).

My question is of anyone can give me an advice about a certain driver or even sent one over the mail (if possible). If anyone can help I would be very pleased.

Greetings from Roel.

5614. TOS 2.06

>
>MicroEMACS 3.11 is on atari.archive.umich.edu:/atari/Editors (might be in an
>Me directory). There's also JOVE and Mutt2...

I've been using ST MicroEMACS 1.8 that came with MWC. It crashes
randomly, and once crashed. never works again (except from TOSWIN) when
installed as TeraDesk's Editor. I'm hoping a new one will make it stable
from both TOSWIN and TeraDesk (as the EDIT function).
I'll look for 3.11, thanks.

Version 3.12 of MicroEmacs has been available since April this year.
You can pick it up from midas.mgmt.purdue.edu in dist/uemacs312.

However that version, just as its predecessors, doesn't work properly
with MultiTOS/MiNT. Of a whole series of problems I fixed the most
nasty ones to make it usable again. I have been working with it for
about 3 monts now and I am reasonably happy with it. If you want my
fixes then drop me an email.

: When I upgraded to TOS 2.06 on my Mega 4 ST there was an icon file
: that came with it (from Oregon Research Assoc.), but I never could
: find any docs which stated how to install these icons.

You could either use a Resource File Editor (e.g. ORCS (PD)) or the easier method is to get two programs from ftp sites, called ICONJUGL and MAKEICON. ICONJUGL is by Codehead Software, and allows you to change the order of icons in an RSC file, as well as deleting them and adding new ones. MAKEICON actually allows you to edit specific icons at pixel level.

5617. Accessing a pipe in C++

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-26 13:30:30 UTC
From: cherborth@semprini.waterloo-rdp.on.ca
Message-ID: <H.eg.DfAv&Nv0h7Y@semprini.waterloo-rdp.on.ca>
Source record: 35771

Yesterday, I wanted to create a small program in C++ (I need the practice!) that would access the TOSRUN pipe that TOSWIN creates under MiNT... Unfortunately, I can't seem to open the pipe for writing!

This is really more of a C++ newbie question, but I didn't want to bother posting it in comp.lang.c++ (it would've been lost in all the "Visual C++ vs Borland C++?" and other DOS/Windoze-specific stuff) because it relates to MiNT too...

Here's what I tried:

```
// Open the TOSWIN pipe for writing.
ofstream tospipe( "U:\\PIPE\\TOSRUN",
ios::out | ios::app | ios::nocreate );
if( !tospipe )
{
// Complain with a dialog.
GEMalert nopipe( resource, NO_TOSWIN );
nopipe.Alert();

// Exit with a "File not found" error
return ENOENT;
}
```

Now, that should've worked (as far as my knowledge goes), since TOSWIN was running. ios::out | ios::app | ios::nocreate should've opened it for writing, appending, and it wouldn't create the pipe if it didn't alreay exist.

The "can't open the pipe" dialog always comes up. :-(So, since I can't compile GEM++ programs under MiNT (with tcsh running; bash 1.12 seems to want to prevent me from working on u:/, but that's another story, and hopefully 1.13 will behave better once the port is finished) I created a small program to try various open flags:

```
ofstream tospipe( "u:\\pipe\\TOSRUN", ios::nocreate );
if( !tospipe )
{
// Whine to the user.
cerr << "Couldn't open the pipe.\n";

// Exit with a "File not found" error
return ENOENT;
}
```

I always see "Couldn't open the pipe." on stderr.

So, what am I doing wrong? I've tried "u:/pipe/tosrun",
"U:\\PIPE\\TOSRUN", etc, various open flags, etc. I suspect there's
some strange detail I'm overlooking.

Thanks for any help!

5618. Re:MiNT and Neodesk 3

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-26 13:40:56 UTC
From: mjw@crosfield.co.uk
Message-ID: <1993Nov26.134056.3503@crosfield.co.uk>
Source record: 35766
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Just a simple question on using MiNT

Is there any way of running Neodesk 3 under MiNT.
TOS version is 1.4

The problem is if you run up MiNT and then run Neoload (either from the desktop
or by making it autoload in desktop.inf) it says that Neodesk
must be run from the auto folder or the installed desktop and gives up. This is
reasonable as MiNT is running the desktop.

If you try and run Neoload in the auto folder, after MiNT nothing happens,
again reasonable because MiNT takes over when it is run and presumably will
miss out any other auto folder programs.

If you put Neoload in before MiNT it comes up but you get lots of errors
saying 'can't find resource file' and then MiNT crashes.

I suppose that one way is to fire up TOS 2.06 which has most of the nice bits
of Neodesk in.

Any solutions or idesa please !!

Many Thanks in Advance
Mike Wilsher

>a printer driver fo laserjet or deskjet.

This is true. I have the Deskjet 510 myself and it works great with the
ST and SpeedoGDOS.
If you want to use colour on the deskjet 500C I suggest you look at
Imagecopy 2 which supposedly gives excellent colour output on a deskjet
510. By the way, I think Calamus has drivers that will give colour on de
deskjet 500C. If you are not using the colour, it is best to temporarily
replace the colour cartridge with a black one in the printer. It is very
easy to do so.

Dear Netters,

Anyone want to buy a 24 Pin printer?

It is a Star LC-24/10 Mono.

Reason for selling is that I have moved on to a HP Laserjet 4L, and have no use for the dot matrix. Also, I want to buy a Towercase for my STe, and need some money....fast, before the Northern venue of the Atari Show. I have also been on the lookout for HardDrive mechanisms and am strapped for cash to buy the tower.

The printer is in good working order, with all manuals, and box(also in good condition). There are also 3 reinked ribbons (only reinked once)....so you can see that the printer has only been through 4 ribbons (3 orig + 1 reinked).

Can be seen working.

So, please amil me with 'sensible' offers.

Yours in anticipation,
Danny.

As a wild guess, you DON'T in fact call v_opnwk() but call v_opnxwk().
But I don't know the parameters for this call, nor the correct
spelling (!) of the function at present. It does exist in the Lattice
libraries.

Even though it is forbidden, one must take care of error recovery.
The current versions of multiTOS still hang if something goes wrong
in the AES. (And that happens very frequently).

as warwick suggests, gnu cp is not intrinsically slow or anything:

options you have to speed up things:
- compile it with larget buffers
- use a HD decent driver
- and/or use a decent HD cache (most modern drivers have some
sort of configurable caching built in).
- and/or use foldrXXX to increase TOS directory and/or data buffers
- make sure you have a decent HD to begin with. (ratehd should
be able to tell you how your hd is doing.).

cheers,

The woman at Atari who wrote the printer drivers for AtariWorks and SpeedoGDOS was hired on contract to just do that. She is on very friendly terms with Atari, and after the holidays, I will try to push for her to write some new ones. The Epson Stylus 800 is supported indeirectly with the 24pin drivers for other printers, and the results are more than acceptable.

I would like to see a driver written for this too. If anyone knows how to write these damn things let me know and I will forward the info/files to Atari so they can take a look at them.

I thought it just gave the drive number?
I need a bit more information than that. At least the full path.
At the moment I send messaged via a pipe which indicate which
window to be concerned with and what has happend (e.g.
added files foo1.bar and foo2.bar) It works quite nicely but I
would like to expand it to be system wide somehow.

5626. Need Help with CD-ROM

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-26 20:27:39 UTC
From: trek@cbnewse.cb.att.com
Message-ID: <CH48u7.KKo@cbnewse.cb.att.com>
Source record: 35775

Has anyone successfully gotten a Texel DM-5024 CD-ROM (scsi 2) drive
working on their Falcon? If so what driver software did you use?

The following is what I have tried:
My setup:
Falcon 4/80 running Multitos and ICD Pro v6.1.4
ICDCDG0.XFS file under the multitos folder
drive set for scsi id =0,
(tested with and without termination, with and without auto,
and with and without parity in all combinations)
with and without cdrom in drive before boot

What I always get: at start of boot up sequence, I see the busy light
on the cdrom driver show access (scsi init I assume). It takes longer
before returning to green if a cdrom was in drive. I don't notice
any delay in how quickly the internal hard disk starts whether the
cdrom drive has a cdrom in or not. (with cd in, there is overlap
between cdrom busy light and the access of the internal hd.)

During the loading up of the cdrom driver, I get the message:
ICD CD Rom driver for Multitos
line about ICD and Atari and Multitos and Eric Smith
Device 0 is not responding
Rename ICDCDG0.XFe ...
(really hard to catch exactly because display keeps scrolling)

I take it that the device does not respond when queried by scsi id #

On trying install devices under the options menu, no device is put up
for G. If I manually install a device for G and try to open in, I get
"device not present" message.

After boot complete, I can run idcheck and it comes up with
SCSI 0 Texel CE ROM DM xx24 K

Ratehd won't show anything for the CDROM.

I have also tried this set up with a SCSI Syquest (terminated) following
the cdrom drive in the scsi chain. (scsi id 2)

The Syquest shows up fine but still no cdrom. the Syquest "device
installs" fine, with G-J devices for the 4 syquest partitions. (Even
after changing the ICDCDK0.XFS - still no cdrom.

I tried calling ICD this morning but they are off till Monday. I have
a show I am attending Sunday and would like to have the CD ROM working
for it - hence the plea for help.

I thought it strange that idcheck finds the device ok and even knows what it is but it won't be found during boot (also tried relogging drives - both with and without a cd installed in drive - but that again left it undetected.)

Anyone out there with any hints/ideas or am I just up a creek for Sunday?
Thanks for reading this far, Wayne

5627. Offgibit() & Ongibit() problems

Newsgroup: comp.sys.atari.st.tech

Message-ID: <ggxbZbe00WB20dElc9@andrew.cmu.edu>
Source record: 35776

Hi guys!

I have been trying to use the Ongibit and Offgibit functions to modify the Port A registers but I encountered several strange problems.

According to all the book I have, it is suppose to take an int as the bitno to set/clear. However, it seems that this works for Offgibit but not Ongibit. For example, I can use Offgibit(5) to reset the Centronics STB line but Ongibit(5) does not clear the bit. I tried (32) and it worked so I thought that it might be 2^5, but I also noticed that my Drive A kept spinning.

A little later, I tried Offgibit (32) but that will not turn off the STB nor the drive spinning. The strangest thing is that Offgibit(0), or even 4 resets line 5 too!

Could someone help me clarify this?

The way it works has not been documented properly until recently.

Ongibit - the value is a mask where each bit to change is set. Unset bits
remain unchanged.
Offgibit - the value is a mask where each bit to set is clear. Set bits
remain unchanged.

So offgibit 0xbf turns the speaker on on MSTE/TT and Falcon and Ongibit
0x40 turns it off.

I have the ATSpeed C16 emulator card and it can access the Serial port
over the COM port of a PC program. My modem came with a PC program which
normally works ok. You can get a few problems occasionally, but so do ST
com-programs.
Oh, yes, it seems that the version of ATSpeed I have is limited to 2400
baud. So the fax option of the PC program will not work, and I have to
use an ST program for that (9600 baud)

Apparently they company was/is (i don't know) working on an improvement,
but I haven't heard anything yet.

Anyway, I hope this is any help.

Michael

5632. Connecting a TV to a Mega ST

Newsgroup: comp.sys.atari.st.tech

From: i921652@redgum.ucnv.edu.au
Message-ID: <2d75n5INNgqv@sheoak.ucnv.edu.au>
Source record: 35781

A friend has just purchased a Mega ST4, and a monochrome monitor. He'd also like to play a game every now and again, but doesn't have the money to spend on another monitor. I was wondering if anyone still sells RF modulators for these, as I seem to recall seeing such a product advertised long ago. If not, how hard would it be to connect an RF modulator from something else (such as an Amiga)?

Hope someone can help,

Jared

UK>But it is known that the AES is NOT reentrant, so it is a bad idea to
UK>call the AES from inside itself, but that can under a single tasking
UK>OS only happen if you do that within the drawing function of a userdef
UK>object, and there it is explicitly forbidden.

The major problem on reentrant AES calls, is that within an AES call, the AES performs a task switch. This is even hard to handle under normal circumstances with single AES and no reentrant calls, expecially if you want to do anything behind the trap.

Who could ever say what happens if you do a reentrant call, or under MultiTOS, or under MagiX!, or with any combination of these. There is nearly nothing documented.
[ok, MultiTOS and MagiX! together would crash ;-)].

I really doubt that you (the originator of the first article) could write a handler, that works under any environment. But i am absolutely sure, that you would break the trap handler i wrote and almost any other program, that is fiddling in Trap #2.

Greetings, Hayo

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I'm trying to build a gcc cross compiler on a BSDI system, to generate ST executables.

So far I've built cc,gcc,as68k and ld.

Now I need a libgcc.a file, according to the docs it *cannot* be created with gcc ????

Any info on what I need to do/get to create the libgcc.a file would be appreciated.

Mike

Funny.

(1) There has never been a flood of drivers at all.
(2) The driver file format really is totally straightfoward, there's
NOTHING mysterious about it.
(3) Atari *supports* people by having the driver kit. Why not contact
Atari and get it?

While we're on the topic, I've always felt that it was a poor design decision not to simply return an error code when an unimplemented AES routine is invoked. Instead, the program is aborted with an "Undefined function #" alert box and bombs, which is a crude and unclean way to terminate.

As a result, for example, you can't just call fsel_exinput, then test for failure and invoke the older fsel_input afterwards (possibly with your own added prompting label outside the selector. (Just testing for TOS >= 1.04 isn't a complete solution, because earlier TOS'es can still handle the fsel_exinput when a custom selector is installed.)

>Is it possible to use an ATARI laser printer and the ICD host
>adapter "the
>Link", together?

Yes. Connect The Link to the "Output" port of the last drive of the ACSI
chain.

Example:

You have an ST, a Megafile hard drive, an SLM laser printer, an ICD The
Link.

You connect:

ST -> Laser controller -> Megafile -> The Link -> SCSI devices.

The laser controller MUST be directly connected to the ST.

> users do, the ST seems to have a higher signal strength).

You might install some resistors to be on the safe side. I have an NEC Multisync II, and from the info file I found about making the switchbox for it, it showed three resistors (that were optional). I used them to be on the safe side. I can't remember how many ohms they were on, but I think they were connected to the R, G and B signals. I have the circuit at home if you need it.

I know that some dealers sell a TOS 2.06 board with a switch that allows you
to change between your "old" TOS version and the new 2.06.
This should make it more compatible. I have TOS 2.06 (no switch etc) but I have yet
not had any problems with any software due to that.

When I looked, I didn't see an ST binary, only MS-DOS and MS-Windows versions. I brought the code in only to find that it would not compile with Mark Williams C V2.0. (Although I did manage to get it built under VAX/VMS and OpenVMS AXP.)

The documents that come with the distribution state that for a $25 fee, you can get an up-to-date binary and printable documentation. I sent a check about eight weeks ago and have heard nothing....

So it goes.

>makes a new screen in memory, the same as the current screen.

Make me wonder: Why don't these graphics card companies who HAVE written
their own VDI's write a version that provides exactly this?

There is also another problem: very few (any?) VDI's allow you to
vro_cpyfm from a standard-form MFDB to a device-dependent MFDB. This
is a MAJOR blunder! Every VDI should be required to implement at least
standard-to-dev.spec. That way, if you had a VDI whose device-dep format
was the same as standard format, and did off-screen bitmaps, you would
be able to do drawing off-screen, then vro_cpyfm() to the screen.

I really don't understand why this hasn't been done. Developers should
push for this, as it would make VDI programming much simpler.

==========
I too have problems loading ACCs with MiNT (but not MultiTOS) present.
One thing that _always_ causes MiNT to crash (and thus, a reboot), is
Xcontrol, even if nothing else is loaded... none of my CPXs are
resident, either.
==========

Try removing the fastload bit - I know it sounds stupid. Also try re-ordering
the ACCs (I know this shouldn't make a difference, but it does). If all
else fails, try XCONTRO 1.0 - I'm using it on my STE and I've had all
6 accs loaded before. You just gotta be real careful how you do it.

Also, I've found that a bare system is not always the best. Adding or
removing an AUTO folder program may cause ACCs to fail. Even stuff that
may not seem to matter. I had a hell of a time getting my system up
without CHC 4.0. You have to really work at it!

Source record: 35700

```
========================
The latest release of gcc is 2.5.2.

If you were succesful, I'm interested to know about.
========================

Actually, its 2.5.3. While looking for the GNU Objective C compiler,
I got someone to send me the entire 2.5.3 set-up (objective C run-time
and headers, and all 3 compilers and gcc.ttp) - thanks again Mr.Schuller!

However, sh tells me that the C++ compiler is not a file or something.
Something about file not found. After messing with it a bunch, I found
that the problem was that the C++ compiler (gcc-cc1plus.ttp) weas corrupt.
I promptly downloaded mg++253b.zpp from a.a.u.e and installed gcc-cc1plus
and I tried it out. It gets part of the way into the compile and then
complains about a fatal compiler bug and gives an email address for the gnu
folks.

The readme that came in the archive from aaue says that the compiler was
built and then uploaded without testing it.

My first plea is this - if you have a binary, keep it to yourself before
wasting someone elses time. Test it!

My second plea is to anyone that actually has a working gcc-cc1plus.ttp.
Can you Email it to me? Either uuencoded or atob/btoa ? I don't
want to re-install the other parts of the compiler and I'm assuming that
I won't have to as long as its 2.5.3. I don't want to lose the Objective
C compiler as I've tested it and THAT works.

Can anyone help?

Well, after a short discussion with a close relative, I am now considering an OkiLaser 400 (as well as the Cannon BJ200).

I would appreceiate any reflective comments about pros/cons/compatibility/et al.

BTW, my dad has this laser printer and really seems to like it. Over Thanksgiving I did some printing from Wordperfect and Drawperfect. My results seems to show that text-printing is outstanding (beats the daylights out of my Panasonic KX-P1091i I'm using presently!! :), but I'm unsure of graphics -- the Drawperfwect output seemed a little chunky, but I think I might have had Printer Control set to output "medium quality" graphics. Is "high quality" a marked improvement?

Also, I'm thinking that bumoing the '400 up to at least 1.2 meg would be ideal -- how much will this upgrade cost me?

Also, what about toner/drum replacement cost/ease?

Thanks for _any_ information! :-)

Newer versions of MiNT (i don't know which version, probably after 1.04) will also run the auto folder programs after itself, i.e. it doesn't have to be the last auto program. It also fiddles with the basepage chain so that MiNT is not visible. Thus maybe a newer version of MiNT can help you.

The TT can run any of the great GNU software, including GCC. Some of
them will require MiNT to be usable.

You don't. The driver allocates the buffer and returns it (just as the SLM printer driver).

And for the bits it won't runs it's not the TT's fault, it's a more general
problem of the 68K's versions, like some GCCs...

Or is anyone above 2.3.3 really reliable??? ;-)

> DOS or Un*x without too much trouble. You could character graphics and
> line drawing symbols for the widows, the menu bar would just be text like
> a DOS app, etc. Is it possible?

Sure it's possible, but it's disgusting... Those hellspawn DOS apps that
wish they had a real GUI (ex, DOS 5's "edit" and "dosshell") are evil,
and really, really bad to use.

If you used C++ and abstracted your input/output, you could write both a
text-based TOS output class, and a GEM-based set of classes, and have
both... From your program, you'd just go:

```
output << "This is some output.\n";
```

And it'd appear in a window or plain text, depending on which output
class you'd used...

> That's what puzzled me. It said that the built-in delete function was not
> found. Come to find out, delete is really a small function that calls mfree()!
> Not exactly the most efficient way (function calling a function), especially
> since I don't think a library function can be inline, can it?

Depends... delete _has_ to call free(), since it does some work, then
frees the memory. free() calls GEMDOS's Mfree() function, so you're
actually calling at least two other functions when you delete something.
Function call overhead isn't that bad.

> I never thought of doing that. It makes sense though to get it from an
> OS/2 or Un*x section or whatever, since it should all be the same.

You're right; I spent a few minutes on Friday formatting GNU C++
documents on my OS/2 machine at work.

> ASCII docs on umich would be great (Postscript would make my FX-85 crunch
> for a few hours, and I'd have to find Ghostscript).

texinfo is ascii; if you get the texinfo documents, and GNU texinfo from
atari.arhive, you'll have nice online versions with hypertext links and
everything. Pretty slick for a text applictaion... doesn't even use
those icky text "menu" things... ;-)

> Everything. Well, the idea is that I don't know if I'm missing something or
> not!

Grab the docs from a unix or Os/2 or whatever setup, and ignore the
machine-specific stuff. The Atari port is much more like the unix
versions.

Source record: 35712

Hullo...

I have a 520STe and a Sony CPD-1302. I'm having problems getting this monitor to display Mono resolution. The picture won't stop rolling. I also get intermittent `interference' that seems to increase the 'whiter' the screen gets.

According to an EE friend this is indicative of TOO MUCH current being fed to the monitor (by the ST). I've hooked this monitor up to another ST and a clone and the 'problem' wasn't present. Also, we've noticed that the clones we've seen send out 'brighter' signals.

But... what I'd really like to know is this...

What are normal current levels for 520ST's and 520STe's.

I'd also like to know what typical current levels are for CGA,EGA, & VGA (if anyone knows those).

Yeah!
At least the versions >=2.5.2 seem to be _VERY_ likeable now.
I've even compiled MiNT with 2.5.3, I'm running 2.5.4 now, and everything's just fine.
Also, G++ 2.5.4 runs very stable and produces running output. (I've spent some time
on compiling the newest groff, which is mostly written in C++).
So, the 2.5.X (x>=2) is really it!

Greetings, Joe

>RF modulators for these, as I seem to recall seeing such a product

Well, I can't help you with the RF bit, but it is possible to connect
the ST direct to the TV via a special Scart cabel. If your friend has a
TV or Video with a Scart input, this should be the best (and cheapest)
solution..

Status: OR

Multisync monitor switchbox and cabel (this is tested and works)
"""

If you want monochrome your monitor must handle 71 Hz frequency
NOT all monitors do this - To be sure - Test before you buy it!

Multisync side (no pin number - they depend on your monitor outlet)

Red Green Blue HorSync VertSync Ground
| | | | | |
| | | | | |
SW1---SW2---SW3-------. | | |---SW4---.
| | | | | | | |
| | | | | | | |
Red Green Blue Monochrome HorSync VertSync Ground MonoDetect
7 6 10 11 9 12 13 4

Atari ST, STE or MEGA STE side (number as in operating manual)

The switch you need must be of the type with 4 pins in that can be
switched between 2 x 4 pins out (two choices) and works like this:

Switches 1,2,3: When in color red, green and blue passes straight
--------------- through without contact with each other or mono.
When in monochrome they are all disconnected from
ST RGB and instead all connected to ST monochrome

-------- ST RGB (in color mode)
Monitor --------- SW
-------- ST Mono (in mono mode)

Switch 4: Open in color, monochrome detect not connected.
--------- When in monochrome monochrome detect is connected
to ground (this tells the ST it's in monochrome).

Monitor GND --------------- ST GND (always connected)
SW ------ ST Mono Detect (in mono)

Don't worry, the worst bit isn't making this - it's getting the
13-pin Atari monitor connector for the ST side and solder it !!

>

i just compiled gcc 2.5.5, used it to compile the library, the
new libg++-2.5.1, warwicks gem++. could it be that you are running out
of memory (gcc is not always very graceful when it runs out of memory,
depending on which memory it is (alloca() memory) it just crashes).

2.4.5 was the last version that i would say was really stable

2.5.5 should be much better for g++ users, with little or
differnce from 2.5.4 for plain C.

cheers,

I got the same error. I think its the compiler. The readme said that
whoever built it, never tried it out, so I think its a matter of a bad
port than the GNU original being bad, so we just need someone to
report it (not me, my hard disk is too small).

[stuff deleted]

>
> // Open the TOSWIN pipe for writing.
> ofstream tospipe("U:\\PIPE\\TOSRUN",
> ios::out | ios::app | ios::nocreate);
> if(!tospipe)

I don't particularly like IO Streams, they create lots of code for
doing relatively simple stuff. Especially for what you want to
do. You just want to write a string to file, which hardly requires
an object oriented approach. C++ includes C so I'd say to use it.

Here's a peice of the code I use :

```
fh = Fopen ("U:\\PIPE\\TOSRUN", 0x02);
Fwrite (fh,strlen(cli)+1,cli);
Fclose(fh);
```

Note that I use mode 2, which is read + write, which could possibly
be your problem since the flags have a whole new meaning when applied
to pipes! It may be the problem, and it might not. My command line
is all set up before getting to the above code, and the last part is
return 0 (to exit from main). I'm sure the above is alot more efficient
than iostreams!

IOstreams probably have their uses, but trying to convert the flags
used by a semi-portable implementation of file-io into the equivalent
for pipe io may just be too difficult.

However, I'm wondering if anyone would be interested in starting a
"group" project, either on the newgroup or by E-Mail somehow that would
develope a simple life-simulation using C++. I was going to do this
by ATARINET, but found that my write access was revoked, so i have full
guidelines written up.

CYA

GCC version 2.5.5 is now available.

The file gcc-2.5.4-2.5.5.diff.gz contains the diffs from GCC 2.5.4 to
GCC 2.5.5 and is 76271 bytes long.

The file gcc-2.5.5.tar.gz is 5994481 bytes long.

These files are located in pub/gnu of prep.ai.mit.edu and the other FTP
sites listed below.

This version fixes bugs reported in GCC 2.5.4. Numerous C++ bugs were
fixed.

Unless there are serious bugs discovered in this release, we expect this
to be the last release in the 2.5.x series. GCC 2.6.0 will be the next
release and should occur sometime around the spring.

[ All versions of gcc since 2.0 also contain compilers for C++ and Objective-C.

Most GNU software is packed using the new `gzip' compression program.
Source code is available on most sites distributing GNU software.

For information on how to order GNU software on tape, floppy, or cd-rom,
check the file etc/ORDERS in the GNU Emacs distribution or in GNUinfo/ORDERS
on prep, or e-mail a request to: gnu@prep.ai.mit.edu

By ordering tapes from the FSF you help us continue to develop more free
software. Media revenues are our primary source of support. Donations to
FSF are deductible on US tax returns.
```

The above software will soon be at these ftp sites as well.
Please try them before prep.ai.mit.edu! thanx -gnu@prep.ai.mit.edu

5677. Lattice C cls command

Newsgroup: comp.sys.atari.st.tech
Date: 1993-11-30 09:47:33 UTC
From: c2sgy@dmu.ac.uk
Message-ID: <1993Nov30.094733.17561@dmu.ac.uk>
Source record: 35724

Does anyone know of the command to clear screen. I thought there was a command in dos.h called CLRSCR which is apparently only in MS-DOS machines.

Is there an ST equivalent for clearing a screen as I searched through the manuals and haven't found a simialr command.

Any help would be nice. I do have the original so just quote page numbers if you want :-()

You could send the VT52 escape code to clear the screen. Is
it char 12?

Well, subject says it: Under Unix you can install several versions of gcc
in several directories and determine which one to use with a -V switch.
I've never managed to do something similar on the ST. Is this feature
not in the atari version of gcc (say: mint versions) or what?

I know there's a way to get the TOS font to be 8X8 instead of 8X16.
Is it a VT52-type escape sequence? Or is it some call? (I use Lattice C)

Thanks
Jacob

ps: please reply in email as I'm not able unfortunately to keep up with
these groups.

5686. Colour icons on non-new machines.

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-01 00:20:47 UTC
From: warwick@cs.uq.oz.au
Message-ID: <16575@uqcspe.cs.uq.oz.au>
Source record: 35737

Any ideas on how to provide support for colour icons on non-new machines?

Drawing them is quite simple of course, and I could add it just to GEM++,
but I imagine a TSR could also be written to handle this and other
system-wide new object types.

It would need to work without any co-operation from the program (ie. a
program that gives colour icons on new AES's should give colour icons
if this TSR is installed on older machines).

This one is easy: Yes.
The TT runs all GNU programs ported to the ST.
Except from a *very* old port of emacs-18.55, which won't run in TT-ram.
(It will run in ST-ram on the TT however).
The newest version of emacs (publicly available) is 18.59 and it works
perfectly on a TT.

i just sent out a new libg++/headers. it was fully tested with
gcc 2.5.5. that i also sent. please give them a try.

with gcc 2.3.3 you should have been able to use the old
library/ headers though you would not be able to build the library
itself successfully with it.

cheers,

>suite of GNU programs ported to the ST?

I've used almost every version of GCC with my TT.

GCC 2.3.3 - Was the last, and stable 2.3.* release.
GCC 2.4.5 - Served me well. I recommend this.
GCC 2.5.5 - Not stable yet.

In fact, the reverse of what you suggest is true: GCC 2.5.* is having
trouble running on 68000 machines, because it appears to have
optimizations that are generating 68030 code even on a 68000. This
means GCC 2.5.5 will generate programs that will not run on a 68000 -
as anyone would know who's been trying to get my GEM++ working without
recompiling it themselves.

IMO, for compiling work, a TT is a better buy than a Falcon (TT is faster).
Also, you can get a graphics card for the TT for about $500 that gives it
MUCH better graphics than a Falcon. TT still has STe sound though, and no
DSP so if you need them, go Falcon.

Also, be aware of the new MEDUSA and EAGLE TT-clones that are appearing.
The MEDUSA might sound expensive, but it'll speed past a TT any day (it
has a 64MHz [doubled 32MHz] 68040 in it).

For C++, GCC 2.4.5 is far superior to 2.3.3. We still have 2.3.3 on the Suns here at work, and it is a right pain in the @rse when it comes to templates and multiple inheritance.

From: korg@daneel.rdt.monash.edu.au
Message-ID: <2dh695$bq3@harbinger.cc.monash.edu.au>
Source record: 35738

Hello,

A while ago I posted asking about 2 drives with a BMS200 controller.
I was using a Dec 120Meg drive and a Segate St157N.

After experimenting, I could even get the Dec drive to work by itself.

There may have been a problem with powerup settings or something like
that. I resently got another drive, a Quantum and that works fine with
my St157n. So it looks like it was a Dec scsi vrs the BMS version of scsi
problem.

Thanks to those who replied,
cam

This solution only works if the TV has RGB inputs, and doesn't use the composite video signal (which I presume most TV's would do). This is because the MEGA series don't have a composite video output, only a composite sync output on the pin where composite video is on other 1040FM/E 's are. Thus even using a RF modulator driven by the composite line would not work either. You need to use a RGB monitor -OR- (the much more difficult way) , make a composite video modulator for the MEGA (ie provide the ic's and components that are in the 1040/520's but not the MEGA's.

I guess that Atari thought that the MEGA was going to be a business computer and consequently didn't think people would want to use it on their TV's

NOTE: I'm only talking about the MEGA FM's not the MEGA/STE's

5696. Problem: How to format/partition ST157N on BMS200/HDX?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-01 05:20:34 UTC
From: korg@daneel.rdt.monash.edu.au
Message-ID: <2dh9j2$cg2@harbinger.cc.monash.edu.au>
Source record: 35739

Hi again,

The latest version of HDX can correctly determine the type and size of the drive. (Yaaa waited for this feature!) But then it goes off and says "Drive not responding, check connections" or something. When formatting my Seagate ST157N.

The BMS program (bmsinit) can not format seagate drives correctly because of some oddity of the drives (they can not do their bad block check or something) so they have a seperate program to do it.

Fine so far. But the problem comes when I want to make a partition bigger than 16M. HDX wont let me do it because it didnt format the sucker. Bmsinit cant do it.

Ideas on how to get a 16M+ partition?

SCSI, what a standard. :-)

Sigh,
cam

PS: The Quantum I have formats 1.2G in, like, 10 seconds. But media checking takes AAAAAGGGGGGGEEEEEEEEES! I assume it just flags the areas as formatted and formats them on the bad block check. Can anyone confirm/deny?

Char 12 is Form Feed. I don't know if that clears the screen!

There is a vdi command (v_clrwk) described at page 122 (Volum III)
to clear virtual workstation (e.g. the screen).

Though, if programming for GEM this is NOT the way to do it.

Yes, this feature is patched out, for whatever reason (in my own
version (under MiNT), i have removed most of the atari patches, i can
even use gcc -pipe).

I would like to get more information on the MEDUSA (68040 TT clone).
I have been waiting for 4 months now for a new TT and it does not appear
that Atari can deliver.

I need to know the following information :-

1) How compatible is the MEDUSA system with other Atari computers.
2) What version of TOS does is use (if any).
3) What are the available configurations / price.
4) What are the performance advantages over a TT.

If anyone has direct or indirect experience/opinions of the MEDUSA system
I would be delighted to hear from you.

- Chris

In article do2@charm.magnus.acs.ohio-state.edu, jpoling@magnus.acs.ohio-state.edu (Jeff A Poling) writes:
> What patch programs do I need with TOS 1.04?

TOS 1.04 or Rainbow TOS, as it is commonly known is the latest version of TOS available for 520/1040/MEGA owners. It has been available as a dealer upgrade for awhile now. It has much more robust Disk I/O, Autorunning of GEM programs at boot up, a fix for the 40 folder limit, and much more. Most of all is it much faster than previous versions of the Operating System.

Formats: 2 chip ROMs, 6 chip ROMs (available as Upgrade!)
Machines: Stacy
Utilities: TOS14FIX.PRG, POOLFIX3.PRG, CACHEXXX.PRG, FOLDRXXX.PRG
TOS14FIX.PRG solves some small problems in the AES (for additional information, please see the documentation that accompanies the TOS14FIX.PRG program).
POOLFIX3.PRG fixes a bug in GEMDOS. Documentation that accompanies the POOLFIX3.PRG program explains (in detail) the problem that it fixes.

The information was taken from "TOWNS' LITTLE GUIDE TO REVISIONS - VERSION 1.0".

These are the specs of the New MEDUSA (price unchanged)

You may post this wherever you like.

MEDUSA T40
==========

MC 68040 at 64 Mhz
Internal FPU and PMMU
Performance is around 26 MIPS, 4.5 MFLOPS

Main bus is:
32 Bit Data, 32 Bit Address
Bus Clocked at 32 Mhz
Full Bus snooping read and write

Atari bus is:
16 bit Data, 24 bit Address
Bus snooping, write
Own ACSI Address for full 32 Bit Address

Fast RAM
Can hold 8-128 Megabtes on board
Write 73 Mbyte/sec
Read 85 Mbyte/sec

EPROM is
2 MByte on board
32 Bit Wide

TOS 3.06 modified slightly

I/O

-DMA
-MIDI
-SERIAL
-PRINTER
-KEYBOARD
-FLOPPY DD, HD, ED
-2 SERIAL PORTS (like TT Modem)
-IDE Bus (12 Mb/sec)
-ISA Bus (for own custom Graphics Board)

Additionally you can get:

-VME Bus
VME Bus 16bit

Laser Printer Port (?)
ROM-Port
Mega Bus
-SCSI Board
TT SCSI
SCSI II
TT Lan
-DSP Board
DSP96002

and an MC68060 Board is sceduled for the year 1994

LEXICOR SOFTWARE CORPORATION

There's a IDE-adapter from Hard & Soft to get a IDE-drive connected. It
works on a 1040 STF. IMHO it also works on a STE. For more details :

Hail to you, world of the net.

I have a big problem that comes in a little question :

i want to use a bigger output-buffer (about 5kb) for the serial line on my ST, and
i want to do it with PureC 1.0 and Tos 1.04.

Is there a system call to set a new buffer ? I tried with "Iorec", but i only got
bombed.

Hi there

I am using a Mega ST 4 with Rainbow TOS, HBS240 (16MHz with cache and FPU)
My question:
Is there another perhaps better Version of TOS which I can put into my ST?
If so where can I get it?
Are there any problems with Harddisks? (I am using a Megafile 60 and a Syquest 44)

If you have some infomation for me concerning my questions please e-Mail me because I don't know when I am back in the Net again
My e-Mailaddress: frog@stud.ee.ethz.ch

Thanks in advance
Martin

5713. Compiling GCC 2.5.x for MiNT

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-02 11:50:14 UTC
From: jdmt@dcs.ed.ac.uk
Message-ID: <CHEovr.Aoz@dcs.ed.ac.uk>
Source record: 35665

Hello,
a while back I posted an article asking how difficult it would be
to compile Gcc 2.5.x on my TT . Loads of people told me that it was actually
quite easy, and indeed it was. However, when I compiled Gcc-2.5.2, I patched
it with the gcc-2.5.0 diffs from atari-archive's Gnustuff/Tos/Gcc directory,
which produced a copy of Gcc which doesn't believe in -pipe or -V.
I am about to compile Gcc 2.5.5, so what I want to know is what patches
are _essential_ to get Gcc running under MiNT ? In other words, how can I compile
GCC for MiNT _without_ disabling any of Gcc's features?

Another problem that I encountered was that my new, 68020/68881 version
of Gcc 2.5.3 refuses to compile the Mintlibs - it complains that _exit has
been redifined. My old 2.4.5 ST-MiNT version of GCC has no such problems, so
I guess that it must have something to do with a compilation option in the
GCC-2.5.x source . How do I get around this?

I hope someone can help me out again,
Thanks in advance,
Cheers,
Joe

Well, what's the latest version in your opinion? My latest version (believe
me, it _is_ the latest, it's pl9) runs fine on a TT with memory protection.
Maybe yours was compiled with a broken gcc???

> "Visual C++ vs Borland C++?" and other DOS/Windoze-specific stuff)
> because it relates to MiNT too...

Gee no responses... Don't tell me that Warwick and I are the only ones
using C++ on the Atari platform...

Yesterday, I managed to figure out how to open a pipe from C++; either
of these approaches will work:

```
// Open the pipe for writing.
#ifdef OPEN_FIRST
int pipe_fd = open( "u:/pipe/Test.Pipe",
O_WRONLY | O_NDELAY ); // Pity there's no O_NOCREATE
if( pipe_fd < 0 )
{
// Whine.
cerr << "Woah, can't open the pipe.\n";

// Just pass the error back to the world...
return pipe_fd;
}

ofstream tospipe( pipe_fd );
#else
ofstream tospipe( "u:/pipe/Test.Pipe",
ios::out | ios::nocreate | ios::bin );
#endif
```

If you use the OPEN_FIRST method, you should close(pipe_fd) when
you're done with it.

Have you considered the HP DeskJet 500? I've had mine for a couple of
years, and have never had problems finding drivers or utilities to use
with it. The output from something like PageStream or SpeedoGDOS
(normal GDOS can use a LaserJet II driver if you can't find a DJ driver;
the same is true for any other programs) is great, and it's a reliable
printer (I've never had a problem, and I've probably printed 3000-5000
pages).

5717. FOR SALE: Atari Hardware&Software

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-02 13:55:41 UTC
From: (unknown)
Message-ID: <1993Dec2.135541.7717@NCRTimes.stpaul.ncr.com>
Source record: 35666
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech

For Sale:

* 1 meg, Atari 1040STe w/Rimik

* Magnavox ICM-435 14" color display w/stereo sound and tilt/swivil stand
(only 4 months old)
* Supra 45 meg Hard Drive w/DMA and SCSI thru ports

* Rimik Beatle Mouse

* Epyx 500 XJ Precision joystick

* Fitted 1040ST Dust Cover

Included & Pre-installed software (just some of the many, many titles):

* NeoDesk 3.0 w/NeoDesk CLI
* Word Writer 2.0
* Deluxe Paint ST
* Dungeon Master
* Their Finest Hourt
* Copy II ST
* DEGAS Elite
* Flash
* DB Master
* GFA BASIC 3.5e Upgrade
* Gunship
* STar Wars
* Joust
* Neochrome Master
* Arkanoid II
* Guild of Theives
* Major Motion
* A-Copy 1.2
* Tetris
* and over 100 additional games, applications, and disk utilties including some r are and
one-of-a-kind programs (never commercially released, ect)
* Atari ST Internals book
* ST Gem Programmer's Reference book

All items are in great condition.

I'm asking $675 (US funds) or best reasonable offer for the whole thing. I'll even pay
shipping (in the continental US) if I can sell it prior to Dec. 10, 1993.

This is a great system folks - reliable, cheap, and even more compatible with existing software than the Mega STe and Falcon.

Please direct all decent offers and/or inquires to me at my e-mail address:

feldak79@snyoneva.cc.oneonta.edu

Thanks,

Ari Feldman

I have installed MultiTos on my Harddisk.
There is just a fiew things, that puzzle me:

How does C:\AUTO\MINT.PRG find it's configuration?
During the installation you are asked, at which
folder MultiTos should be installed. Is this
information burnt into MINT.PRG?

By which programs is the file C:\MULTITOS\MINT.CNF
consulted?

What is the accessory ALERTS for ?

Thanks in Advance!

5721. Supra SCSI -> ST-DMA problems...

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-02 18:31:15 UTC
From: fdomingu@rainbow.UWaterloo.ca
Message-ID: <CHF7G4.D1M@watserv1.uwaterloo.ca>
Source record: 35677
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'm currently tyring to install a Supra Corp DMA - SCSI controller for a friend in combination with an Imprimis (180meg) SCSI drive with not much luck. I have disconnected the controller from the Supra Box and applied the +5V to the board then connected it to the drive and computer. When the controller is off (ie no power and not connected to the SCSI port of the Hard Drive), the drive will spin when powered up, however, when I power back up another time with the controller hooked up to the drive, it will not spin up (the drive light does turn on).
In all cases, that the Supra controller is powered, the Green LED does light up.

The whole board is composed of pretty basic TTL, but, I have noticed that 3 traces have been cut intentionally and rewired on the circuit side of the board.

On the bottom it says....
SUPRA CORP
(c) 1987
30-0014-5

If anyone has had any problems or can give any suggestions as to what I might be able to do or try please email and I can create a summary.

Directly, just by MINT.PRG. However, environment variables set in MINT.CNF stay around until they are changed or unset, so any other program can look at the environment variables.

>What is the accessory ALERTS for ?

ALERT makes error messages appear in an alert box--without this they will appear directly on the screen.

Help!

Many many moons ago I switched my old Mega 4 from a 2-chip set of TOS 1.02 to a six chip set of TOS 1.04. I followed the instructions according to Atari, required the removal of the 74LS11 chip, changing the position of w-2 or w-3 on the board, and running a jumper across w-4. recently Ive been having problems with a video-card conflict, and the only thing I can find wrong is that the diagram on the circuit board makes it look as if the jumper specified by Atari should have been a resistor of some type (the design running between the front and rear of W-4 is the same as the design where resistors are installed elsewhere on the board). Im not a electronics genius (I can solder, install accelerator boards and such, but I have to have *instructions*), so Ive got no idea how to figure out exactly what sort of resistor, if any, should be put here. Anyone want to lend me some helpful advice?

Thanks!

I would like to OCCAISIONALLY hook my ST's external HD to my STacy.
I would like to use both this external HD and the internal HD at the same time;
or at the very least the external drive only.

How should I set my drives up to accomplish this?

I'll second that; the HP DeskJet is very nice, very cheap these days,
and they switched ink formulations to get rid of the "don't get it wet"
problem (smeared easily if you got it wet after the ink had dryed). With
Tim Gallivan's excellent 'ghostscript' port, you can even print PostScript
files on it with ease, and there are several other nice utilities on
atari.archive.umich.edu like HP_R_SAVE (prints small but crisp screen dumps).
You can even buy ink cartridges in other colors besides black!

> or at the very least the external drive only.
>
> How should I set my drives up to accomplish this?

I do this fairly regularily. It's easiest if you run a driver program which will accept gaps in the HD id#. (The ordinary AHDI versions (3 5?) stop looking if the id# tested doesn't respond.) Then you can set things up with suitable id# so they work for both configurations without further changing. I use ICD PRO and have various hardisks set up as id# 0, 1, 2 so they can be mixed in several different ways on my different systems. ICD has an IDCHECK program which can be helpful in identifying what settings you have on various units currently on your DMA.

Anyway, your internal Stacy drive is id#0, so the external one should be set to id#1 (or higher) when connected to the Stacy DMA. Alternatively, you _could_ set the Stacy HD to a higher id# (assuming you like chinese box puzzles and want to try and open your Stacy, but that is *not* recommended.)

If your external drive is a Megafile, then there is a DIP Switch centrally mounted on the motherboard - with luck you can even twiddle the switches through the hole in the shielding once you remove the plastic case. Just flick sw#1 (not the first one, sometimes marked "X" on the board). If this kind of switching is required often, you might consider pulling a lead from the DIP (leaving its switch in the open position) and mounting an external switch. The setting is only read when the *drive* is turned on.

If your external is a SCSI with adapter, then you'll likely need the jumper pinout diagram for that drive to identify where the id# is set. Using a program like IDCHECK, you can with a bit of testing find the id# jumpers by working your way through the pin-pairs until you get an id-response >0.

Again, if you have/install a driver program for the ST which can correctly identify (boot) from a drive configured as #1 even if there is no #0, the easiest is to permanently set the external drive as #1.

>
> How should I set my drives up to accomplish this?

All you really need to do is set the external drives SCSI ID to something
other than 0. (I think that is what the STacy uses for it's internal drive.)
This is either done on the drive itself, or with DIP switches inside or on
the back of the case. Without knowing what kind of external HD you have,
I can't help much more.

This reminds me of an idea I had a few days ago. In old TOSes, there
is no way to give accessories a standard environment. Would it be a good
idea to parse the file mint.cnf for that purpose?

mint searches its config file in the root dir of the boot drive, so in \, and also
in \mint and in \multitos, but it is recommended to put the stuff into the latter.
These directories are compiled into mint itself.

>What is the accessory ALERTS for ?
>
It is an accessory which checks for system alerts and displays them, like messages
about programs violating memory protection.

Hope that helps
Ulrich

I cannot see your problem, the newest version (which is 0.60 pl9 up to now) works
fine on my TT with mint 1.09. But you might want to update your mint version and
maybe also try another HD software, as ADHI was known to cause some troubles in
an older version (which are you using?)

MEGA ST2 UPGRADE PROBLEMS....

Well I managed to get a cheap MEGA ST2, I like the case style..

Have been using a 1040STFM with 2.5 megs and TOS 1.4, with a external
240 meg Quantum, near new....

I have not had any problem with this system at all...

I have just fitted TOS 1.4, AdSpeed, ICD Micro Host and Auto Overscan to
the Mega...

Now the problems start...

The main one at the moment is that Neodesk will crash, even with Overscan
disabled, and Adspeed set for 8 mhz by software..

I can fix it with a new copy of the Neodesk RSC file for the res, that I
am using, but after I turn the computer off and restart again, it will
crash at the end of the loading of the EXE file...?? Buss or Address error...

None of these Neodesk files are writen to, so what is going wrong..??

The Hard disks worked 100% on the 1040STFM and no errors are found with
CleanUp...

I will leave the other many problems to later...

What is the latest version of Auto Overscan...?? mine is 3.0zh...

Thanks.....

Roger..... sheppard_r@kosmos.wcc.govt.nz

Jumpers are correct. No resistors instead. I've done the same thing
without having instructions of atari, but I've found the same things
to change by looking at the board and figuring out how the circuit
works. I've described the whole thing in the German magazine ST-Computer
published by MAXON, edition January 1990 (or was 1991?).

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

A while back, when someone was trying to sell a Mega STe they posted a "features list" which I know was a bit flawed, but they stated that the LAN socket on a Mega STe was "LocalTalk" compatible. Does this mean that this port can be used to network a Mega with Macs/Newtons ? or am I missing the point ?

Also, if this networking is possible, is there any software support for this, or information about what would be required to make this work ?

5742. Changing STFM CPU

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-03 12:19:33 UTC
From: gigxr01@nt.com
Message-ID: <gigxr01-031293121933@ngalm099.gal.nt.com>
Source record: 35593

What I want to do is swap my 8 Mhz CPU for a 16 Mhz unit.
I know that this is an old idea, & I might be better off getting a proper accelerator card; But:

(i) I have the 16 Mhz 68000 CPU

(ii) I can easily perform the modification.

What I need to know is what CPU pins do I have to monitor so that the clock switcher logic can decide to switch from 8 to 16 Mhz (& vice versa).

My own opinion is that the AS (BAR) line would be a good one, as it is logic 1 when the CPU is not accessing the buss, & logic 0 when reading/writing. If I swap to 8 Mhz when this is low, returning to 16 when high, will this work?

I have constructed a small module which can do this, but before I unsolder the CPU & install a socket, I have a question:

Is it o.k to swap clocks like this, given that my module's clock is not in phase with the system clock?

Should I take the 16 Mhz feed from pin 40 of the shifter?

Is there a file somewhere that describes this procedure?

>Mint108 is on atari.archive.umich.edu. So is a patch to take 108 to 109
>(I think it is called diff1819 or similar).

Well, since I'm still a bit of a neophyte as far as some of this stuff goes,
how does one "apply" a diff to patch the source? I under stand diff from
the creation process (as in "diff file1 file2") but I'm not sure how to apply the
result (any special program, syntax to do this?)...

I've just been happy that I've been able to compile 1.08 :-)

Rob

5745. Re: MiNT 1.09 bug ?

Source record: 35596

Could someone send me a patched 1.08 miNt to 1.09 as I have tried to update the source for 1.08 (which compiles fine) and get a version which falls apart about a minute into compilation.

Cheers

Pads

Hmm. The version of the MinixXFS was 0.60 pl9, my AHDI is the very latest release (straight from atari). The version I installed the binary from a.a.u.e

& it didn't work.......

Craig.

I have a Maxtor 130 with ICD AdSpeed + in an IBM case.

I figured I would have to switch SCSI ID number on the external drive, I
just wasn't certain. Thanks.

The questions I have now, though, is what happens considering the fact that
both drives will have an executable C partition?

This is very odd, pl9 has changed nothing in the disk I/O that should affect anything other than older XHDI compliant drivers.
Two other pieces of information. There is only one author, me. I am also getting sick and tired of incomplete bug reports. There is a file called 'bugs.doc' with the information I need, I'm fast getting to the point where if I get any more reports thinking I am clarvoyant (e.g. "Minixfs crashed, what's wrong") I'll either ignore them or give up.
Steve.

> just wasn't certain. Thanks.
>
> The questions I have now, though, is what happens considering the fact that
> both drives will have an executable C partition?

I believe it works in the following way. Partitions are mounted from the
SCSI devices in order of device (first 0, then 1, etc.). They are mounted
sequentially (first partition of first device is C, second, D, etc.). So,
if you have your internal set to 0 and your external set to something else,
the first partition on the internal will be the boot partition. The fact that
the first partitoin on the other device is bootable should not make a
difference. It will just be mounted as a regular partition.

Now, you can change this in software (using ICD stuff, at least). The
ICD Desktop utility will allow you to enable/disable partitions as you please.
I am not sure if you could coax it into mounting something else as C and
still be able to get to the earlier partitions, but it might be worth a check.

I have one of my devices set to 1, the other to 3. The device set to 3 has
an external ID switch, so I can change it to 0 if I want to boot from it (it
is a Syquest). This gives me maximum flexability. You might want to look
into changing your internal device to be 1 or 2, and getting an external ID
switch for your Maxtor (they are cheap and easy to install, they simply fit
over your ID jumpers and allow you to set them with an external pushbutton,
no soldering or cutting involved). On the other hand, I dimly remember
something about STacy's really wanting their internals to be ID 0 (I could
be wrong about that).

>
> --Jeff
>
```

I just bought multitos from Toad a couple of weeks ago and cannot find this ALERT program... Could you tell me where you found this- it sounds extremely useful.

So far, my experiences with multitos (on a TT) have been marginal. I have no ACCs and nothing else AUTO-starts, but I frequently get crashes that freeze up the whole machine. Next time it happens (this weekend there should be enough time to escape from working on final class projects and studying for finals (yuck to being a part time student again!)) I'm going to write down the exact errors and consult this group.

Is multitos supposed to come with any sort of real manual? All that was in the package I got was a _thin_ 'getting started' sort of manual that really just walked you through the installation. The doc files available for Mint are _vast_ by comparison.

From: winters@access.digex.net
Message-ID: <2dp3lu$qv6@access.digex.net>
Source record: 35606

Anyone know of any solid term programs that would allow me to use
my Atari 1040ST with 1 MB memory and a color monitor to call
the net or bulletin boards? Sending files is not a necessity at this
point (could use Kermit for that). Just want to see some good
public domain, shareware, or commercial examples of C or BASIC
source code for terminal emulation. Even a program which duplicates the
RS232 Port Configuration Dialog Box would be cool. In fact, did Atari
ever release the source code to the RS232 Dialog Box? Thanx for any
advice.

>> diagnose monitor problems before!

I remember, that some time ago I experienced a similar problem with a monitor of a friend of mine. The problem seemed to disappear if you moved the cord and/or the plug of the monitor, thus we assumed, that either the cord was broken or the connection between the monitor socket and the PCB in the computer was damaged. I cannot remember how we eventually fixed the problem, but I would suggest to check if all wires from the pcb of your computer to the monitor are undamaged and show zero resistance. Only if this does not help, I would resort to checking the other parts on your computers mainboard (possibly starting with exchanging the shifter with another one and checking if this helps).

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Dear netters,

I have just bought a 245 Mb hard disk, and have come across the problem of partitioning it. I can partition the Hard Drive using ICD utilities, but the problem is that I don't know how many partitions and what type of partitions to keep. Maybe the good souls out there in cyberland may be able to help me.

I know that I should keep about 5 Mb for my boot partition. the rest I do not know, how much to keep for TOS, and how much to keep for Minix and MiNT.

My system is :

2.5 Mb STe with TOS 1.06/2.06 switchable. (I am using mem.prg to patch 2.5 meg)
Colour and mono monitors
External floppy
Scanner
Laser Printer
Quantum LPS 240-S Hard Drive.

I will be upgrading to 4 meg soon (I hope) and and accelerator.

How much space should I keep for my MiNT partition that I will have installed on a Minix file system? I am thinking of using Simon Gornalls MiNT Distribution Kit from a.a, or should I go for the traditional way of installing MiNT?

How much space should I keep for this?

Also, I am going to install Tex, Smalltalk, Gnu C, C++, SB Prolog, Ghostscript along with other utilities. will i be able to run these under MiNT (As it would be nice to use extended file names like more.file.names). If so these would have to be in a Minix File System running under MiNT.

I am also going to install Minix v1.5, and think that I need about 32 Mb of Disk space, or do I need more, as there are Gnu utilities for Minix, around?

The rest I will keep as TOS partitions, and maybe DOS and Spectre partitions when the time comes.

Thanks in advance for people who reply to this query.

Danny.

Can't confirm the above. I run minixfs v.0.60 (this is the latest version
I have access to, unfortunately you didn't quote your version) under MiNT0.95
without any problems apart from MiNT0.95 insisting on loading xfs's twice...

minixfs runs in Turbo mode, and update has shown no flaws so far, either.

On my BBS there is a free TSR that I wrote in an archive called "rsbuf.arc". This TSR works like the CACHEnnn and family where it looks at its name in the AUTO folder and sets the buffer size to that many K. E.g. RSBUF4.PRG sets the RS-232 buffers to 4K. The BBS number is USA 510-530-9682. The file is in the ST area and is available to all callers. It has probably been posted to other places too, but I couldn't tell you where.

Many thanks to all for your help. I tried using 150 ohm resistors in the R G and B lines, but didn't get very good contrast so I reduced them to 47 ohms and now have a quite reasonable mono display on the Viglen monitor. But...
For some reason the top few lines of the display are off the top of the screen, making it hard to see the menu bar items. The monitor has (SVGA) Horizontal Size and Position controls but no Vertical control is provided. Perhaps it's happening because of the Atari's vertical scan rate being a bit higher than 70 Hz (some say 71, some 71.25, some 72). Any ideas???

> a look at the schematic and post a answer soon.

A followup to this note, if you want to determine if your Atari has
composite video output then, as a general rule of thumb, if your atari
has an RF modulator then it will have composite video output on the
monitor connector. In other words this means that the MEGA fm series
were the only ST'f without composite video. But I'm not sure about the
Stacy or the STbook. Also the MEga STE's have got d

an RF modulator so
they also have composite video on the monitor connector.

You will need to set the external hard drive to ID number 1 as
the internal drive will be ID 0. This means that you have to boot off
the internal drive.

I suppose you are talking about the version I did. I compiled g++ with bammi's patches, the only difference is I'm using MiNTLib, not GNULib.

"Untested" means I have tested if it starts ok, but since I'm not using c++ at home I can't tell wether the compiler has serious problems with compiling complex or simple c++ sources.

Get the new g++lib from a.a (update36), I think this one is ok for gcc-2.5.[3-5].

Cheers, Thomas.

PS: I think my mail adress is in the readme. I got no mail describing this problem...

2.5.4's cc1plus still produces an address error (3 bombs) on a plain ST
with 4M; I didn't test cc1 too much but at least it didn't crash on
hello.c... :-\

I'll try 2.5.5 as soon as it moves out of New on a.a.u.e; I've heard
that 2.5.x also have sever problems on Linux and other x86 and 0x0
architectures... from the sound of things, they were being pretty
optimistic when they said 2.5.5 would be the last 2.5.x...

I've never actually seen that in action... When I run MiNT (1.08; 1.09
soon) it doesn't load anything after it in the AUTO folder.

5769. Voice-Mail on the Falcon!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-06 00:20:43 UTC
From: Jinlung Fung <jf4y+@andrew.cmu.edu>
Message-ID: <Yh0bfPS00WB4EIk7o0@andrew.cmu.edu>
Source record: 35627

Hi folks!

I have recently started developing a voice-mail system for the Falcon (are there commercial systems around at the moment?) and managed to get some encouraging progress. The hardware side is pretty much done up and it is now left to the software development to include some pretty powerful features.

I am looking into the possibility of releasing the voice-mail system as shareware but there are certain problems like FCC approval of devices hooked up to the phone line. I am still looking for a way around this.

However, I would like to make a small survey of whoever is interested in this system, so I would know if it is worth the effort to look further along these lines. Send me an email with your opinions, suggestions etc.

Thank you.

Ta Ta For Now,
Michael Fung

Considering that Black Mail from Digital Optical Analog has been in the wings for over a year for the F030, any progress would be interesting. As a channel for a VAR item, voice mail could be quite lucrative. Imagine it as part of a stand alone phone/voice mail system marketed directly to business...

Hard to implement but that is how you make money!

How would you distribute hardware as shareware? Do you handle DTMF
decoding?

Ofir ogal@cix.compulink.co.uk

5773. How fast are your True color Polygons?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-06 09:14:52 UTC
From: wilsont@rahul.net
Message-ID: <CHLwCt.20C@rahul.net>
Source record: 35639

After applying my new True color polygon routines to a 3D app I'm
mucking around with. I find that gobs of time are spent drawing
the polygons. (1.66 200hz ticks on average)

"average" is defined by a C for-next loop generating random points for
a 4 sided polygon, and then plotting.

I found that using 'towers' in my machine code didn't garner any significant
(detectable even) difference over a tiny little loop. I assume the cache
is what makes the loop run as fast as the tower.

Example:
d7= pixels to write.
d0= color.

```
loop:
movew d0,a0@+
dbra d7,loop
end:
```

```
** VS ***
lea _tower,a1

movew #320,d6
subw d7,d6
addal d6,a1
addal d6,a1 | set up for jump
jmp a1@

tower:
movew d0,a0@+ | 1 pixel
movew d0,a0@+
movew d0,a0@+
movew d0,a0@+
...
movew d0,a0@+ | 320 pixels...
end2:
```

the point is, I tried loops, I tried towers, my polys are still slow.

Can anyone give me some general polygon tips (pixel packed only please)
tips to speed up mine.
I'd also like to hear what other people have gotten out of their falcons.

Thanks. i'll post a summary.

If you want to patch, use patch :-)

The latest version of patch is 2.1. It is available from any GNU
server, and there should also be a compiled version on a.a.u.e.

First off, you don't say where you're using RGB or VGA. The problem is one of
memory bandwidth and VGA 320x240xTC uses more than twice the memory bandwidth
of RGB 320x200xTC because of line doubling.

The problem with your linear code (aka towers) is that it is big to fit in
cache. This exacerbates the the memory bandwidth problem since all the
instructions have to be pulled from memory and it makes your linear code
potentially slower than a tight loop. What you really need a loop
with a smaller piece of linear code in it (the exact size will depend
on the surrounding code and whether you are try to fit the Bresenham loop
in cache as well).

Another thing you might try is to use move.l to fill two pixels at once.
This wins for large polygons but loses for small polygons because odd length
run lines need to be detected and an extra move.w done.

You might also try blitting from halftone RAM; but I'm not sure how fast this
is.

There are also some tricks for optimizing the Bresenham calculation. Finally
unless you want to smooth shade or texture map your polygons why do you need
```

TC? 256 color and movem.l instructions would be much faster.

|> been redifined. My old 2.4.5 ST-MiNT version of GCC has no such problems, so
|> I guess that it must have something to do with a compilation option in the
|> GCC-2.5.x source . How do I get around this?

This has to do with a change in the way how non-returning functions
are declared. GCC <2.5 uses

```
volatile void _exit();
```

but GCC >=2.5 uses

```
void _exit() __attribute__ ((noreturn));
```

The former was a violation of the ANSI standard. The next version of
the MiNT library will hopefully contain the necessary changes.

Best thing to do is have TOSWIN automatically pop up a window which runs CONSOLE.TTP, similar to what the Sunview standard environment does. It gives you more information when something goes wrong. And you'll need it as well. I regret but have to say: MultiTOS = MultiCRASH.

I see. So basically you're working on a system that lets you hook up
your computer to a phone line so that you can use the DSP to actually
use the phone to transfer speech? Brilliant!

There's more to watch out for than the FCC... I think AT&T/Bell has the
rights for what you just invented.

I doubt that this is easy to achieve... A TSR would have to provide
enhanced versions of several AES-functions, i.e. rsrc_load() and
objc_draw(). ...oh, and probably even appl_getinfo() as well.

IMHO it is simpler to provide two resource files. Well, by the way
this TSR already exists. It's called Multitos. :-)

Message-ID: <gigxr01-061293115540@ngalm099.gal.nt.com>
Source record: 35623

Many thanks to those who replied to my posting on changing CPU speed.

I got the thing working last weekend, with the original 8 Mhz CPU still
in the machine. The speed increase is not really obvious, it just feels a
little bit faster on redraws, etc.

Still, it only cost a few pennies to do :).

Don't know how long the 8 Mhz CPU will last if it spends some time running
@ 16 Mhz, but I have the replacement ready.

Now , if there was some way to speed up memory access (I have a marpet
Xtra Ram with 4 meg of 70 nS Simms) ??

I am interested in getting my hands on some schematics for the STFM/STE.
I know that Atari publish some tech manuals, but do they include Circuit
Schematics in these?

That's one of the problems. One way is to mail the hardware ready-built... another way is to describe how to build the hardware but I think that will be a nightmare. I favour the first way better.

As for DTMF decoding, there will probably be two versions, one that acts just like a simple answering machine and a 'deluxe' version that will allow you to page thru' menus using touch-tones, much like those you hear on commercial services. I am planning some other extensions to these to make it even more useful, example selective ringing.

Would turning on the debugging help find out what's happening? What gets me is that ND 3.03 is supposed to be MiNT compatible.

I spoke to the UK importer yesterday (Neal O'Nions) who went blank when I mentioned TOS err #-1 ("There's no such code"), and suggested I use Geneva. He doesn't recommend using Neodesk anyway, which is strange.

This does NOT speed up things very much. Since the Blitter gains its speed
by addressing pixels in plane-modes. (where the CPU would have to rotate etc.)

For the suggestion with the loop fitting into the 256Byte-Cache, I just can add
that then you should set the Write allocate-Bit in the Cache Register of the
CPU. (Don't ask me right now, what worth is best, I don't know that by
heart...)
This can speed up things like hell!!! (I did it with my old Fractal-routine.
It gained about 70% of speed!!!!
The same thing with Griff's small sphere-demo-routine that was hacked, speeded
up and spread by An Cool (?). After having set that WRITE ALLOCATE Bit, it
worked on VGA-Screens at 60 frames a second...

But do not try this out with the desktop (in Tos 4.0x) it won't work
(only if you do not want to use your disk-drive) Though this has changed in
MultiTOS where they included that Cache On/Off Switch...

Have a nice day

I suggest getting the hard drive. I don't know how I lived without
one on my ST!!! Besides, from what I've heard, those 16-MHz 68000
accelerators are hardly noticable at all. One person quoted a
whopping %8 speed increase for just $150! That hardly sounds worth
it... If I were you, I'd spend my money on:
hard drive
mono monitor (or multisync)
more games

J> I use my STE about 75% for games playing, about 20% for games
J> programming (STOS), and about 5% for word processing etc.

I *think* it's possible to let the BLiTTER do the drawing while the
CPU calculates the next polygon, if you can get the code to fit in
the 68030 instruction cache!

I haven't tried this, coz I haven't got a F030 yet...

5790. CPX and appl_init (Part Two)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-06 17:42:51 UTC
From: hn@minipicc.informatik.rwth-aachen.de
Message-ID: <hn.755199771@minipicc>
Source record: 35549

Some weeks ago I asked about how to get a valid AES GLOBAL field for a CPX.

Finally, I found ATARI's example sources for CPX development:
The right way is to call a appl_init() in the cpx_init function
of a CPX as shown below.

```
------------------------------
CPXINFO
*cpx_init( Xcpb )
XCPB *Xcpb;
{
xcpb = Xcpb;

appl_init();

if( xcpb->booting )
{
-- stuff deleted --------------
```

Note that there is no appl_exit()!

I'm quite surprised to see that this code works.
This appl_init() fills a global field with the AP_ID of XCONTROL.

I'd had expected that the appl_init() returns a unique (growing)
AP_ID any time when it is called. But in fact it always returns the
AP_ID of XCONTROL. And: why isn't an appl_exit() needed?

Any explainations ?

From: cm5206@ccub.wlv.ac.uk
Message-ID: <2dvrf3$dvj@ccub.wlv.ac.uk>
Source record: 35550

Hi everyone,

I was recently reading a demo called 'DARKSIDE OF THE SPOON'.
In the scroll text of one of the sub-demos the coder talked
about the possibilty of using the MIDI/Floppy Disk controller
chips to perform direct memory accessing block copying. He
suggested programming the FDC to write to the disk drive, but
without starting the DISK drive up. It would then write the data
back into memory but with each bit shifted by 1 position.

My question is has anyone done this or heard of this?

Secondly. I have two STE's, each has a pair of 256K simms in.
I tried putting all four simms into the one machine to make the
computer one meg, however this does not work. I belive this is
becuase the SIMMS are configured for 512K computers only.

Dose anyone know how I can get around this or reconfigured my
chips?

Thanx in advance!

Rich...

I have to disagree with that 8% figure. I've got the ADSPEED STe,
and the difference is VERY noticeable, in every application in
every way except for I/O (e.g. disk access, serial port, etc...).
I have to admit I'd recommend
the hard drive too, but the extra speed is worth the money.
(Especially in Steel Empire!)

I have had an ICD ADspeed-ST for the last 4 years and could not live without it. It give about a %50 overall increase in performance. And when coupled with a screen accellerator things really fly. However most games do not support a 16Mhz CPU. So you will need to have the CPU start in 8Mhz mode, for game compatability, then switch to 16Mhz mode in your AUTO folder.

Of course now that I have a TT the ST rarely gets used.

Having said all that I'd recommend getting the hard drive first as that will get rid of most of your annoying delays booting your system, and starting applications, loading/saving files.

Brian

Get the hard drive. For one, you will find that your system has much more utility with a hard disk. For another, it is my understanding that the accelerators can cause some games to not function. Also, the accelerators don't really give you a lot more performance. Better to just get a faster machine in a couple of years (Falcon?!?).

Also, 40mb is pretty small (hard disks are like potato chips, believe me). Try to get an enclosure that allows some expansion. An ICD host adaptor is highly recommended.

Just my $0.02.

>>(I think it is called diff1819 or similar).

> Well, since I'm still a bit of a neophyte as far as some of this stuff goes,
>how does one "apply" a diff to patch the source? I under stand diff from
>the creation process (as in "diff file1 file2") but I'm not sure how to apply the
>result (any special program, syntax to do this?)...

Go and get patch.ttp (patch.zoo), copy the diffs into the
source-directory and say:

patch < diffs

Patch tells you what it's doing. All 'hunks' should succeed and the
original files will be renamed to <patched_file>.orig. If any hunk fails
you'll find the rejected patches in <patched_file>.rej. Be sure to work
on a Minix partition if you can.

For MiNT 1.08 to 1.09 you'll need the switch -l (patch -l < diffs)
because of incompatible characters at the end of each line.

> I've just been happy that I've been able to compile 1.08 :-)

Congrats! ;)

>You need version 1.6 of the Diablo emulator.
>
>Mfg,
>
>Wilfred Kilwinger

Hmm... Version 1.6, eh? I'm in a generally bad mood today so
I'll take this opportunity to throw out a generic complaint. Ever
since I started investing in Atari h/w and s/w around 1986, I've
dutifully sent in all those little registration cards. To date,
I've spent more on software than hardware (and with an ST, Mega,
laser printer and TT, that adds up to quite a lot) and so far
have received ONE (count them, 1.0000) notice from any
software company about upgrades. (And that was for TouchUp.)
Now to me, these cards ought to count for something more than
just a vehicle for companies to build up mailing lists.

Is the market _that_ small and response to upgrade notices
that poor that it's just not financially feasible to send them
out? Or is everybody else getting theirs and I just have an
anti-atari daemon hiding in my mailbox eating the notices?

The Diablo emulator I have is the same one that came with the
laser printer when I bought it 5 or 6 years ago. Ditto with
ultrascript. I've read that both of these had upgrades along
the way, but I've certainly never received any upgrade offers.
(I don't expect free upgrades, just notices that they exist...)
In the case of Warp9, I bought directly from Codehead only to
see messages on Genie only 6 weeks later of an upgrade (for
$25 no less) and have yet to receive any notice about it...
(Not that I could use it now anyway since I run multitos
normally, but still...)

(Oops - hold the presses. I did receive upgrade notices for
Prospero fortran, quite regularly in fact - up until the point
they seem to have left the ST a couple of years ago...)

Sigh.

Don't believe it. The speed increase is noticable. When switching from my AdSpeeded ST with TOS 1.02 (slow anyway) to my unmodified STacy with TOS 1.04 I can really tell the difference.

Benchmarks show an average speed of 183% of spec. Speed increase varies from application to application.

However, I would recommend the HD as the first purchase.

HELP!

I have several Amiga fonts that I need to convert to the GEM font format.
Does anyone know of a program that will do this conversion???

How about a program to convert from TrueType fonts to GEM fonts?

Failing that, where can I find a good technical description of the GEM
format, so I can write my own?

As a last resort, how about a good source of ftp'able GEM fonts?

Thanks for any and all help!

>optimistic when they said 2.5.5 would be the last 2.5.x...

2.5.6 is already out due to "major bugs" in 2.5.5.

The hardware manual is the STE Computer Field Service Manual
(Part no C302481-001 REV A Aug 91)
Has full circuit diagrams and repair instructions for the STE only.

Best Electronics in California sell them, they used to exhibit at
the atari computer shows in Wembley. This was where I got my copy
Email if you want the address.

It looks like it's going to be a hard drive then.
Shame it seems so many games are incompatible with the accelerator, I would have liked an increase in the frame rate of simulations.

It works for me. Are you sure that you have really anything
physically located after MiNT? Or, you have renamed MiNT to
something other than mint.prg or mintnp.prg.

I am not sure using the BLITTER will be so efficient.
If you let the BLITTER do the points, as long as it runs
the same speed as the 68030, you won't gain time.

If you really want to gain much much time, you could use
the DSP, but it is another problem ...

|>
|> I hope someone can help me out again,
|> Thanks in advance,
|> Cheers,
|> Joe

I got the same problem when compiling Mintlibs with GCC 2.5.3 on my
MEGA Ste.

The problem comes from Mintlibs' includes. The definition for function _exit()
is not the same in all includes : sometime, it's declared as "volatile" and
sometime not.

To correct the problem, put the same definition in all includes.

You may have the same problem with the function __exit(), so do the same thing.

Good luck.

>hard drive
>mono monitor (or multisync)
>more games

I don't have an Adspeed, but a Mega STE (16 MHz) and I think the concept is similar, and I can tell you the increase is between 1.5 and almost 2 times (for calculus) what is is ai 8 MHz (with cache on). WIth NVDI, it's wonderful.

It will increase the speed of some games, too... Vroom is twice faster (woooowww !!!) Formula One's is twice more accurate, (I say twice, but it may be 1.5 :-) as well as EPIC and some others.

BUT if you use your ST for anything serious (programming, Word Precessing etc.) you won't be able to do without your hard drive after you've tried it...

I bought my first hard drive because I was programming a quite big thing that didn't fit (sources+binaries+includes+libraries) in two drives and a RamDisk (I was using Turbo C) any more... I saw the difference !!!! Compiling a C program is ten times (at least) faster with a hard disk (say, 20 times instead) .... But with STOS, you may not need such things and prefer the speed improvement... Don't forget, some games can be installed on Hard drive too, (Ishar, Ishar II, some others) and if you use one of them very often, that could justify your buying a hard drive...

To sum up, I'd say that many things are impossible to do with a HD, as many things are much more friendly done with an accelerator, but NOT impossible. Of course, the best is to have both... :-)
Don't forget, buy a SM 124 screen if you want to work, too....

Bye Patrice...

5817. Using an old Protar host adapter with a new Hard Disk

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-07 11:57:37 UTC
From: adw@ukc.ac.uk
Message-ID: <7015@eagle.ukc.ac.uk>
Source record: 35563
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am trying to use a second hand Protar host adapter to attach a SCSI
hard disk to my ST.

I am having difficulties caused (I believe) by the fact that the hard disk has
not been formatted in advance for use with the Protar adapter.

The software I have for the adapter (Progate manager v4.0) doesn't seem to want
to recognise that there is a hard disk present (to allow me to format it).

So, does anyone know if what I am trying will work?

is there software for formatting a hard drive that will work through a
protar host adapter?

does anyone have a newer version of the Protar software that will work in
this case?

what else can I do (short of buying a new host adapter)?

Lloyd.

P.S: I have tried other software (the closest to working of which was the hdx
part of ahdi which at least caused the drive select light to turn on - but
nothing else).

When I looked, I didn't see an ST binary, only MS-DOS and MS-Windows version\s.

True, unfortunatly, but I have uploaded an uemacs312.zoo to a.a.u.e.

I brought the code in only to find that it would not compile with Mark
Williams C V2.0. (Although I did manage to get it built under VAX/VMS and
OpenVMS AXP.)

I haven't got MWC 2.0 anymore, so I can't verify nor fix that problem.
I use MWC 3.0.5 which works fine. There is at least 1 bug and fix for
3.12 on VMS. Can't give you more details because I lost interest in
VAX/VMS and consequently don't keep track of MicroEMACS events on it.

The documents that come with the distribution state that for a $25 fee, you
can get an up-to-date binary and printable documentation. I sent a check
about eight weeks ago and have heard nothing....

I know Daniel Lawrence is very very busy with lots of different
things, but I agree that 8 weeks is a bit long. I suggest you drop him
an email.

Below I have included the readme.1st of the uemacs312.zoo.

Ed M. van Gasteren,
ed_m_van_gasteren@ns-nl.att.com

--

This is a partial distribution of MicroEMACS 3.12 for the Atari.

The best place to get more of the whole package is dist/uemacs312 on
midas.mgmt.purdue.edu. That is where Daniel Lawrence puts it. But you
will not find an Atari executable there. So here is one!

I will continue to work on MicroEMACS, particularly the Atari part of
it. If you have questions, remarks, suggestions, bugs, fixes ... then
don't hesitate to contact me.

Ed M. van Gasteren,
ed_m_van_gasteren@ns-nl.att.com

- emacs.prg

I used Mark Williams C version 3.0.5 to build it from ue312dev.zip and the few changed files you find here. I have found no problems, but plenty warnings, in the building process.

- estruct.h

Configured appropriatly.

- word.c

Fixed delete-previous-word. It deleted the wrong part of the buffer.

- input.c

The common routine for buffer, file and command name completion was not re-entrant. I had a problem with that in a rather complex $exbhook.

- st52.c

-- Removed several local #defines in favour of those provided by MWC. Substituted some hardcoded numeric values and (x)bios calls with #defines.

-- Obtain the size of the whole screen (WF_FULLXYWH) iso of just the work area (WF_CURRXYWH). My 1040 STf with TOS 1.4 and my Falcon with TOS 4.02 returned different values in the latter case. That resulted in not being able to get to the desk menu on my Falcon.

-- Initialize the number of rows and columns better to use the whole screen and to adjust better to different screen resolutions.

-- Open a full screen window inorder to be able to get back to MicroEMACS by clicking in it (after you went someplace else).

With MiNT/MultiTOS it appeared that I needed a window handle anyway to determine if mouse button events and such stuff were for MicroEMACS.

-- Handle some of the window change related messages in combination with mouse control better. Before you had to click on a accessory in the desk menu sometimes more then once to get to it.

-- Removed the first/second mouse handler stuff and the event queue that came with it. There is no need for stmouse.s anymore.

With MiNT/MultiTOS you simply can't get away with grabbing the mouse vector because you don't alwasy 'own' the mouse.

-- Mouse button events with shift, ctrl and alt now return the proper key code.

-- Mouse move events implemented.

Most games will run happily at 16Mhz, but some copy protection techniques
fail if they are not run at 8Mhz. Of course this isn't a problem on my Falcon
as I Backwards II installs a hot-key to switch to 16Mhz after loading. :)
F1GP is fun at 16Mhz...

5822. dialogs in a window

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-07 16:37:08 UTC
From: richards@sulu.orl.mmc.com
Message-ID: <1993Dec7.163708.28519@iplmail.orl.mmc.com>
Source record: 35580

I have been trying to use a set of windowed dialog routines put together by Erlend Nagel (can't seen to reach him by E-mail) for use with Heat-N-Serve C. I am having a problem getting any edit fields to respond properly. The cursor will move between edit fields, but it will not allow input into those fields.

The dialog in question works fine using regular dialog function calls.

Has anyone else had success or failure using Erland's winddial library or a similar library of routines that allow dialogs in windows???

E-Mail responses or post them here.

I spotted it trying to read a U:\NEODESK.DAT file which didn't exist,
so I created a link to one in MINT.CNF. Still get the problem though.

I'd be interested in the fix, if you can locate it!

The debug mode sure does print a lot of stuff, doesn't it? Neodesk
keeps calling Super() every second or so, I wonder why.

|>
|> The MEDUSA T40 is a 68040/64 Clone based on TOS 3.06, the machine is

Incorrect. Although the MEDUSA is advertized to run at 64 MHz, it is only a 32 MHz machine. The Guy who constructed the beast specifies the MC68040 at its internal clock rate which is twice the external (and Motorola-official) rate. To my knowledge, the fastest 68040 sold by Motorola runs at 40 MHz.

Price/Performance: about 15 Months ago, i have been very impressed by the performance of an early prototype of the box (was an ST accelerator). But 6000 DM for a system with only 8 MB RAM and 240 MB IDE-Disk is expensive. Consider the Linux-box You will get for the same price (roughly twice the RAM, twice the disk capacity, twice the speed).

Or, consider a SPARC Classic clone. Recently i saw 6900 DM for a system with 15x2.54-cm monitor (in germany it is illegal to write inches :-)), 16 MB RAM, 1 GB Disk, Solaris 1.x or 2.x (+15 % tax).

Or consider the DM 6000 (incl. tax) i paid for my 25 MHz SPARC clone w. 17x2.54 cm grayscale monitor, 16 MB RAM, 422 MB DISK, SunOS 4.1.2 one year ago? This system is about as fast as the 32 MHz 68040 of the MEDUSA !!.

Concluding: the MEDUSA is probably a very nice system, so nice that Atari should licence it and sell it under the official label (Atari: this might be cheaper than the development of the urgently needed powerful system, doesn't it?), but the prices have to drop a lot before the system will be competitive to the real world. (Atari was: power without the price. Now it seems to be the opposite).

Michael Ritzert

BTW: i still like my good old accelerated Mega ST!

5825. Speeding up GNU Fileutils

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-07 22:03:55 UTC
From: mjr@geob7.geo.uni-bonn.de
Message-ID: <2e2ukb$aif@news.rhrz.uni-bonn.de>
Source record: 35575

Recently there was a discussion in this group how the speed of cp and mv of the
GNU distribution
could be improved. I have written a quick mod which has a drastical effect
on the performance. It might be still improved --- e.g., allocate space
for buffers in power of two sized chunks. I don't provide diffs because i
have only very old sources of the fileutils available. So diffs to my sources
are of limited use. My changes are within the #ifdef atarist portions of the
code fragments below. I hope the parts of the code i supply suffice to make clear
how to implement this in the most recent version (just posted) of the fileutils.

cat should also be modified in a similar manner (i don't have the source at hand).

Here it goes, have fun.

M. Ritzert
mjr@dyn.geo.uni-bonn.de

A few days ago a gave myself a kick and compiled MiNT 1.09 (a quantum
step forward, having used 0.95 so far) and since then my TT030 has been
running fine with minixfs 0.60 pl6.

5827. Buffptr() and asm

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-07 23:10:58 UTC
From: Jinlung Fung <jf4y+@andrew.cmu.edu>
Message-ID: <sh1Eq2200WB2AHjFkg@andrew.cmu.edu>
Source record: 35577

Hi folks!

I am having some trouble with the Buffptr() command. It does not seem to return the pointers correctly. I have an xbios(0x8d, sptr) to call the routine but when I check sptr->playptr, the pointer does not change when I am playing a sample. Any ideas??

Also, does anyone know how to get asm inline code in Pure C??

Ta Ta For Now,
Michael Fung

>> have liked an increase in the frame rate of simulations.

>Most games will run happily at 16Mhz, but some copy protection techniques
>fail if they are not run at 8Mhz. Of course this isn't a problem on my Falcon
>as I Backwards II installs a hot-key to switch to 16Mhz after loading. :)
>F1GP is fun at 16Mhz...
>{{{ Dan }}}

I find that games which access the floppy using their own routines (i.e.
bypassing xbios) fall over at 16Mhz due to timing problems; presumably they
use their own routines as part of copy protection...
Same thing with most 'Smart' formatters (what am I saying, even the 1.04
xbios formatter fails!).

PS. I've only just got access to the 'net, so a big hello to everyone still
going with the ST. One question: All this talk of humungous hard-disk drives
on the ST and very little (commercial) SCSI tape backup stuff.... You can't
seriously backup 120Meg to floppies, even with compression... What does
everyone else _do_?

Cheers, Steve

PPS. I'm not American, depite the address... I'm Scottish and over here
on business for a year (with my ST too, soon).

I have tried several times to request Gemview from
the archives through BART and have been sent error messages.
I have been sending the message:
send/Graphics/Gemview/gview243.lzh
or
send Graphics/Gemview/gview243.lzh
and
send Graphics/Graphics/Gemview/gview243.lzh

Each of the above requests was sent as a separate request.
But BART says that the file or directory doesn't exist. What
should I do? I really want to give this program a look. Please
E-,ail if possible.

>Though, if programming for GEM this is NOT the way to do it.

Argh. Don't mix things up.

If you intend to do a character-based program, use nothing but VT-52
sequences for screen and cursor control. Your program will then run
full-screen on older systems and get its own console window in MultiTOS.

If not, get it right and do a fully GEM based program with menu bar and
window based output.

There's nothing "legal" inbetween.

bye, Peter

Your prices are 15 Months old too :) 6000, DM is about 4,000 U$D am I right?
8 Megabyets of RAM and 240 MB Ide harddrive for the T40 is around 3,000 U$D
ok, ok ok, so its in the USA :) but that's still 1,000 U$D Cheaper...and has
an ET-4000..

>
>Or, consider a SPARC Classic clone. Recently i saw 6900 DM for a system with

Is that a brandnew SPARC or a second hand? Anyway, yes, SPARC is nice too!
I mean...an INDY costs 5,000 U$D only...and THAT's REALLY nice :) if you're
going to take it that far <grin>

>Concluding: the MEDUSA is probably a very nice system, so nice that Atari should
>licence it and sell it under the official label (Atari: this might be cheaper than
>the development of the urgently needed powerful system, doesn't it?),

I would agree, but that is not Atari's style now is it ;)

but the
>prices have to drop a lot before the system will be competitive to the real world.
>(Atari was: power without the price. Now it seems to be the opposite).
>

Define drop a lot.....the Medusa does have some nice things to it like
the on board RAM Expansion to 64 Megs of RAM, ISA Bus for ET-4000 and the

PC Pizzabox Design for additional boards :)

Well...the Medusa is not the right system to compare it with...it is a separate system, designed by an individual company, compare the Medusa to an Amiga 4000 pricing then it isn't so bad, and please do not forget its a niche Market, and the wholesome argument is the use of your Software with it, a new System would ultimately mean a new spendin on Software.

It's also the only 68040 Atari around....

Cheerio

Yat

5833. A common error. Please watch for this.

Source record: 35582

Please remember that:

vro_cpyfm(handle,0,pxy,src,dest);

Is NOT the correct way to set an area to colour 0. TOSWIN does this, and
so it fills the window with as *BLACK* (bitmap 0). Replace it with:

... set fill to solid colour 0 ...
vr_recfl(handle,pxy)

Don't worry, it should be just as fast is your VDI has any brain at all.

This is a very easy mistake to make. Oh well, one day we'll all be using
Falcon030's, FalconPPC's :), or machines with graphics cards, and this
sort of thing won't happen.

Way, way, WAAAAAAAAAAY back when, I heard about the possibility that you could get a bit of hardware and software, under $100 US, that would plug into the DSP port on the Falcon and evvectively emulate a v.32bis/v.42bis modem.

Does this exist? If so, where is it available, and how much?

As I am STILL crawling at 2400 baud, I could REALLY use something like this soon after I get my Falcon... Though my F purchase may be delayed and instead I may be getting myself a US Robotics Sportster from work for myself for Christmas...

Come on ! It's been centuries now we know the 68040 doesn't run
internally at double clock speed, even though there is a little tiny
small negligible part of the processor that uses a clock twice as
fast. The 040 is NOT clock doubled. Go ask Motorola...

But isn't that how Intel specify their chips ? A DX2/66 is only a clock doubled DX33.....but they always advertise the systems as "66 MHz 486". Only the inside of the processor is 66MHz - even the VESA bus is only 33MHz.

>Price/Performance: about 15 Months ago, i have been very impressed by the

>capacity, twice the speed).
>

Hmm...not sure about twice the speed there, Motorola chips are significantly faster than Intel chip of the same clock (they're better designed). And also note that in Intel based systems, only the VESA bus sections actually run at anything like processor speed, the rest of the system is on a seperate bus at a much lower clock. From what I hear the performance of the Medusa is more in the SPARC or high end MAC arena, not in the sub-Pentium PC arena.

>Or, consider a SPARC Classic clone. Recently i saw 6900 DM for a system with
>15x2.54-cm monitor (in germany it is illegal to write inches :-)), 16 MB RAM, 1
>GB Disk, Solaris 1.x or 2.x (+15 % tax).

You could also get a Sparc 2 cw 19" monitor & 32MB of RAM for 3,1936.50 inc vat (UK). But you have to bear in mind that for a SPARC, the cheap bit is the hardware - the cose of workstation based applications make PC & Atari programs seem like PD.

I really, REALLY wish you guys would stop calling it a "64Mhz" machine.
It's not. You can't attach an '040 to a 64Mhz bus. The '040 doesn't
use "clock-doubling" like the Intel monstrosities... in fact, it uses
the clock in a different way.

Didn't we explain this several times already?

This is indeed the point. The TT and Falcon also have this AppleTalk
port.

> Also, if this networking is possible, is there any software support for this,
> or information about what would be required to make this work ?

That's the one thing Atari overlooked... there is absolutely NO
software that I know of that will allow you to network with other
MegaSTe/TT/Falcon computers using the LAN port, let alone a Mac/PC using
AppleTalk.

Are you at all surprised?

Thanks. I noticed the "-l" and tried it (after first not using it).
Makes a difference, huh? ;-)

One thing I learned. If you're doing this on a minix partition, make sure the filenames are the proper case. Took me a day to realize why it wasn't patching right, because I had everything in upper case rather than lower case. Oops :-)

Rob

...proud owner of a MiNT 1.09 binary (and GCC 2.5.6 compiled too!)

There was a big iostreams vs stdio discussion on comp.lang.c++ a month
or so ago...

Personally, I _like_ iostreams; if you think they make a program large,
you should give Warwick's excellent GEM++ a try! :-) Throwing in ~20k
or so for iostreams into a typical program (ie, one that actually does
something useful) isn't that bad.

I define iostream input/output routines for all of my classes (well, the
ones that it's appropriate for anyway) to aid in debugging; under MiNT I
like to send my debugging output to another window, and its easy to do
that with a weenie little pipe server that I wrote in C.

> However, I'm wondering if anyone would be interested in starting a

Sounds interesting... I'd volunteer (as a great way to force me to
learn C++'s more interesting concepts), but I'm way too busy... :-(

This sounds like a great idea... who can we con into writing it? Things like colour icons and hierarchical menus are LONG overdue on the Atari platform.

This would encourage people to actually _use_ the new AES objects, since any Atari would support them. Sounds too logical for Atari to do, someone else will have to.

WINX could do this, but RAM is terribly precious on wimpy 4M machines like mine!

5849. Trouble with harware I sold

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-08 20:04:44 UTC
From: eggert@sun.lclark.edu
Message-ID: <1993Dec8.200444.19721@lclark.edu>
Source record: 35492
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I recently sold a computer to a net user in San Francisco. The day
before I packed the computer and shipped it out, I tested it to make sure
it worked. Everything appeared fine. I played around with several disks
and even loaded Captain Blood for a quick little game.

David received the computer yesterday, and then sent this message to me.

>Hi. The computer came yesterday, but I was not home. It came
>again and I paid the COD in full. The monitor has not come yet.
>
>There is a problem though. I plugged the 1040ST into my Atari color
>monitor. I get the desktop, but no drive icon shows up. Even when
>I put a disk in the drive, nothing happens and no icon shows up.
>Also, when I turn on the system the drive light does not come on.
>Do you know what the problem is?
>
>-Dave Lee-
>ddlee@crl.com
>415-664-7336

I don't dispute that there is a problem with the machine. I assume the
drive was damaged in transit. David said that he opened the case and
checked all the connections but it did not help.

Can anyone suggest possibilities as to what the problem might be and ways
to fix it? Mr. Lee is going to try an external drive this evening, and
if the controller is okay, we'll probably assume that the trouble lies in
the drive mechanism.

We would both prefer an easy fix to trying to deal with UPS for insurance
coverage (I did have it insured).

Please send replies to both dave and myself.

eggert@lclark.edu
ddlee@crl.com

Thanks.
Jon.

But then, would you call the alpha a 200Mhz or 40Mhz processor ?
(actually, I'm not sure about the 40, but it's close)
If the actual clock rate of the processor is 66Mhz, I guess it makes
sense to name it correspondingly, even if the memory bus is slower
(the memory bus is anyway still likely to be faster than the RAM
connected to it...even though HP can do miracles).
So, if the medusa actually uses a clock-doubled 040 at 64Mhz, ...
(funny how Motorola knows how not to make people aware of its new
products) (or is it intel who knows all too well how to take people in ?)

> Hmm...not sure about twice the speed there, Motorola chips are significantly
> faster than Intel chip of the same clock (they're better designed). And also

Sorry Chris, I'll correct you on this one :)

There is Software that supports the networking of Falcon and Mega STe or also just TT Lan.

It is called PowerNET and does exactly that..it's about a year or more old and you can setup your Atari's like a real networking system.

So you can have remote printers and print...midi net access...net mail, joint database with Hyperlink etc.

As for your 68040/64 opinion I am posting an offical post to settle this fun argument :)

One likely cause is one of the socketed chips is making bad contact to the socket. Unless he reseated all of the socketed chips when he checked the "connections", I would suggest you have him open the ST and press down firmly on all of the socketed chips. Sometimes you can't even feel the chips move, but the pressure is enough to fix a poor contact.

Did you ship it with either a floppy disk or the original plastic insert in the drive? If not, it's possible that either the heads or the transport mechanism could have been damaged by shocks in shipping.

I'm dubious whether UPS would pay for this type of damage, since they'd probably consider it to be improperly packed.

5856. MiNT and Minix XFS and software

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-09 14:25:40 UTC
From: vctec@westminster.ac.uk
Message-ID: <CHruLo.3po@westminster.ac.uk>
Source record: 35507
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello again dear netters,

Another problem from a learner in the Atari world ;-) Hope you all do not mind.

I am thinking of installing MiNT on my hard drive (using the Distrib kit by Simon Gornall), and have a choice of installing all the binaries and libraries etc on a Minix XFS partition.

What I want to know, is how stable this would be, and what size partition I should keep for this?

Or should I just scrap the idea, and install everything on TOS partitions? The good thing with a Minix XFS is the long filenames just like Unix.

I am going to install Gnu C, C++, Smalltalk, SB Prolog, Tex, and Ghostscript, along with EMACS and Vi, Heat n' Serve Sozobon C., tcsh, bash, csh. The Distrib Kit installs Gnu C 2.1 (I think), and at the mo, during the test stage of my installation, I have it as a Minix partition. Is it advisable to put all thewse under a Minix partition?

All other software is not really a problem as I will install them under TOS partitions (word processors, dtp, gdos fonts, screensavers, packers etc) Or should the packers go under Minix partition?

What are the pros and cons of using a minix partition, apart from the fact that I will not be able to access it without MiNT?

I have a 2.5 Mb STe (using a patch program), and would like to know what to avoid before I reformat my new 245 meg Hard Drive and install stuff on it. It is running TOS 2.06. I'm sure that MiNT uses a lot of memory and maybe I'll be pushing it trying to work Tex, GCC, Smalltalk and Ghostscript under it.

e-mail to Simon Gornall at King's doesn't help either, as it is returned with user unknown, even though the directory lists his name.

Anyone noticed with TOSWIN, that if you have a process running under it, and close the window, and try and inspect a text file, then only half the screen is displayed? Any ideas why?

Thanks in advance for any replies.

Danny.

I'm gradually getting a decent programming environment set up on my Falcon. The next step is setting up the libraries properly for the GNU compilers. How do the various freely-distributed libraries interact? Can the the GNU compilers use the Lattice C libraries? I presume that mintlib should be searched before gnulib, but do I need both? Any preferences between gemlib and gemfast, or have they in fact converged? For that matter, to what extent do I need to specify libraries in the command line or makefile, and what do gcc and friends search by default?

Does an attempt to add gem++ to the stew have any influence on the rest of this stuff?

Yeah, I collect compilers. Sometimes one does a better job than another for a particular purpose. Right now I'm focusing on getting the GNU C compiler from its present 'works' state to 'works well'. I read documentation, but right now I'm kinda overwhealmed by large amounts of it scattered in too many different places. Pointers may be even more useful than explanations.

Hmm..it goes via LAN to use the same Appletalk Connectors...however I don't
think you can interchange Mac-Atari if that is what you are looking for.

Why hasn't some brave soul looked into getting the Columbia Appletalk
Package (CAP) running over the LAN port on a TT/Mega STe/etc ? (I've asked
this question every 6 months or so for the past 2 years and have yet
heard anything....).

[Look over in Comp.protocols.appletalk for detailed info on CAP.]
CAP is a software suite that allows unix boxes to talk to Appletalk
devices on a network.

5863. zx81 & spectrum emulators: is source available?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-09 23:51:35 UTC
From: zafiris@rtsg.mot.com
Message-ID: <zafiris.755481095@navy16>
Source record: 35516
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I recall mention of the existance of a Sinclair ZX81 (Timex/Sinclair in the states) simulator/emulator for the Atari ST. I also seem to recall that the same author had a Sinclair Spectrum (sp?) emulator also for the ST.

My impression is that both of these things came out of Germany at one time and that there were some legal difficulties in distributing them because of the copyrighted ROMs but that the emulators themselves were in the public domain.

I am interested in the Z80 emulator function itself: the CPU emulator not necessarily the ZX81 system emulator. I'd like to get a copy of the source code for these things if they exist. I presume they are written in either 68000 assembler or C.

Also, I would expect that there are also other such programs that do Z80 emulation for TRS80s or CPM that would also have to be based on a Z80 core. I'd be interested in hearing about them also.

I'd also heard of CPM emulators for PCs and I suppose they would also be useful if they were written in C so as to be portable to a 68000 but my guess would be that they take advantage of the similar 80x86 architecture and are hence written in 80x86 assembler.

So... if you know where I can get my hands on some source code for a Z80 simulator/emulator like those I described above please email me.

thanks... ...John

Try using moveml with lots of registers - that's the standard move-as-much-as-possible solution. You'll need more special-case code at the start of course (code to move the residual words). moveml can be used to move about 56 bytes per instruction (8 dregs + 6 aregs) * 4 bytes per long.

I need to know the layout of the jumpers for the SEGATE 4144R drive i am hooking up to my system. There is a set of 8 jumpers, and three other sets (3 pins, 4 pins and 2 pins) If anyone could telling how to set the jumbers to be the second drive (as well as last drive) on a system as 0,1 OR even Segates phone number would be great.

Because some people claim that Medusa uses a clock-doubled 68040 and
hence motorola would also call it 66Mhz.
The only problem is that I still doubt there exist any 68040 that are
clock doubled (at least, I'm sure that Apple hasn't used any clock
doubled 68040 in any product I know of)

> should keep for this?

Put as much as possible on MiniXFS. The TOS file system is just too lame.

> What are the pros and cons of using a minix partition, apart from the fact that
> I will not be able to access it without MiNT?

- It does have multiple users support. (you probably don't care,
but..)
- It is somewhat faster than TOS (you probaby won't feel the
difference anyway)
- doesn't have just longer file names but just "unrestricted" (as many
dots as you want, at any place. upper/lower case...

Problems:

Most of the problems aren't just minixfs related. The biggest problem
is the "/" vs "\" and minixfs handles it pretty well. The only
problems I could think of are:
- not accessible from plain TOS
- tools for it are rare (like fsck or defragmenting). I'd rather not
have to know what is actually available.

> I have a 2.5 Mb STe (using a patch program), and would like to know what to

If you don't expand your memory, forget about G++. Even GCC is painful
to use (useable, but painful)

I can imagine a TSR which is more compatible with the software around
for the ST/TT series. Of course there is the Falcon. Some of those
machines will eventually also 'terminate and stay resident' as Ataris
sometimes do.

> [...]
> Today a friend gave me 8 256K SIMMs (which makes 2Mo) and I would like
> to upgrade my MEGAST1 computer BUT I have no idea of how to make it.
> [...]

Well, at least the friend didn't _sell_ them to you...

The short message is: forget it! It's not worth the bother to even try and make it work. The long answer? Read on...

MegaST memory is based on 256Kbit DIL RAM chips for 1M machines, but 1Mbit DIL RAM chips as minimum to allow 2M (16 chips) or 4M (32 chips) memory.

Your 1M memory is in fact 32 x 256Kbit DIL filling out all the available socket space, which will cause you some considerable bother to just add more memory and correctly access 1M as 32 x 256K and the other M as 1 x 1M SIMM. It's rather similar to the problem of upgrading a 1040 STE to 2M or 4M, that first step up to 2M means getting 2M as 2 x 1M SIMMs and throwing out at least 2 of the 256K SIMMs that make up the 1M already there.

Ever wonder where all these 256K SIMMs are coming from? ... :-)

You _can_ wire in 1 SIMM (8bit wide) instead of 8 DIL chips, if you're handy with a soldering iron, and upgrade memory with SIMMs instead of discrete DIL chips, but the chip/SIMM sizes should match. In other words, your 256K SIMMs are great for going from 512K to 1M, but you'll need 1M SIMMs to go to 2M (replacing the existing 1M and adding another) or 4M (adding 2M to a 2M machine).

I've upgraded a MegaST 2 to a 4M memory in this way, wiring in 2 SIMMs to selected vacant socket holes. But then the bank selection was the same.

Hi,

A few months ago, ST Format had Prospero C on their cover disk. I have
been experimenting with it, and I like it. I have run across one
problem that I cannot find a solution for, though. How do I change
the stack size?

I would like to convert MasterBrowse over to this compiler, but I cannot
do that if I am limited to the default stack size. Any help would be
greatly appreciated.

5875. Help me please with DSP math!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-11 09:51:23 UTC
From: wilsont@rahul.net
Message-ID: <CHv7Dn.1yA@rahul.net>
Source record: 35526

I'm starting to learn the DSP in the Falcon, I got the motorola book on the 56k and attempted to write a routine that multiplies vectors and matrices together.

In my number system, i use 32767 as "1", so I can get a good resolution when doing sine and cosine.

is 68k I do this:
a0->vector x y z (short)
a1->matrix (shorts, but they use 32767='1')

```
movew a0@,d0 | get x
mulsw a1@,d0 |x * first column

movew a0@(2),d1 |get y
mulsw a1@(2),d1 | y * second column
....do z*third column

addl d1,d0
addl d2,d0 | nx= x*m[0][n] + y*m[1][n] + z*m[2][n]

asll #1, d0 ; set up to...
swap d0 ; shift right by 15. (-1 + 16)
```

Is DSP56k i expected to do this:

```
....loading X0, Y0 from the host....( x* m[0][n] )
mpy X0,Y0,A
....load X0, Y0 again, (y * m[1][n] )
mac X0,Y0,A
...do Z and thirdcolumn...
...

do #15,shifter
asr a
shifter
...
(send A0 to HTX)
```

I wasn't getting the results I wanted.

I also tried the DSP just doing a MPY on 2 numbers, and spit back the result. when numbers were 'big', they'd come back requiring a shift to the left, or to the right.

I'm using Dsp_BlkWords.

The big question is: what format does the DSP expect for its input numbers?
The DSP manual doesn't seem to mention anything about this.or did
I just not read a section? I figured the DSP was a 24 bit 'fixed point'
processor, but what does that mean exactly? why can't I just give it
'normal' numbers?

How would I send it 3.14156 as an example?

Where is a book that tells me all of this?

Help please!

email is appreciated, but not neccessary.

THank you!

Not quite right! My MegaST1 came with 4x256Kbit DIL (or is it 256x4??).
This, and the fact that the (IMP-)MCU is not able to address memory-banks of
different size, made it difficult to expand the MegaST1's memory.
I exchanged the DILs by 4x1Mbit DILs and added MAD9.

Ciao,
Arne

Well, close... the DX2 (or the DX3 for that matter) talkes to the
motherboard at 33MHz... many PCs are not capable of bus speeds like that.

PCI is another matter, but this is far off topic,

IS the '040 capable of clock doubling, or is this just overdriving the
chip beyond the specs WAY beyond reality?

The Medusa is meant to be an ST/TT Compatible, which is also supposed to
have additional option to be Falcon Compatible with the DSP External
Board.

However with the ET-4000 the Medusa is already much more superior in
Graphics than a Falcon or TT (w/o Graphics Board).

Medusa works with TOS 3.06, don't know about the situation with the Eagle
yet as it is not available, to date.

>insert in the drive?

Years ago a friend of mine inserted the plastic thingy into his 1040STf (which was pretty new at that time) before transporting it. Later when he removed the insert he found out that the read/write heads of his disk drive had been torn off by the insert! The entire drive had to be replaced which was rather expensive in 1988. His dealer told him, that this damage was not covered by the warranty since the plastic insert was *not* supposed to be replaced into the disk drive! Even though nowadays disk drives are not that expensive any more and you might be lucky to either not damage the drive or have a friendly dealer who is willing to replace the broken drive, I would highly recommend *not* to use the original plastic insert! If you really think, you need to protect the drive somehow, insert a floppy disk --- though from experience I would not think this neccessary.

Markus

But what about the XBIOS, 3.06 has no DSP support. And it's not only the
DSP that makes the Falcon a powerful music/sound computer, there's the
CODEC as well.

What I don't understand is why they didn't put TOS 4.04 in there. It has a
much nicer AES with popup menus and 3D objects and of course all the DSP
support.

>Don't worry, it should be just as fast is your VDI has any brain at all.

That's for TrueColor display modes.

The difference is: The above vro_cpyfm() call will use color _index_ zero
in palette based display modes, which is "current background color", and
RGB color _representation_ 0-0-0 in true color modes, which is ALL BLACK.

The workaround, according to Atari, is:

Use vrt_cpyfm(). If both background and foreground color pen numbers are
set to the same value when calling, the pointer in the source MFDB won't
be used. So, make it point to the same location as the destination MFDB's
adress pointer. Then, call vrt_cpyfm():

MFDB sourceMFDB, destMFDB;
WORD colors[2];

/* ...setup MFDBs here... */

color[0] = color[1] = 0; /* for current background color */

vrt_cpyfm( handle, MD_REPLACE, pxyarray, &sourceMFDB, &destMFDB, &colors
);

This is documented to work in any display mode on any graphics card or
machine with full VDI functionality.

bye, Peter

The ROMs for TOS 3.06 are arranged to give 32 bit data. The ROM from the
Falcon passes data on 16 bit wide bus, so it ain't compatible. This is
assuming the Medusa will use a 32 bit bus, which it should. You can
officially buy TOS 3.06 roms, but programming your own roms from the TOS
4.04 image sounds a bit dodgy to me.

Bye everyone....

It is a modified versioy nof 3.06, licensed by Atari benelux, exactly
what has been changed I cannot tell you, mainly because (DSP wise) the
DSP board is not ready yet, so we will see then.

I just acquired a Mega ST and it seems to be missing a chip. The chip is designated "U12" and sits just to the left of the MMU chip (as viewed from the front of the board). It is a 14 pin chip. The board is designated "CA200019" and is populated for 2 mBytes. Can anyone tell what chip I need to put in? Better yet, can anyone supply me with a schematic?

Thanks
Jim

Strange question, somehow. The Medusa is compatible with CLEAN applications
written for the 680x0 range of Atari computers. This means, you will face
SOME problems if you want to run some hacks on it (Spectrum 512 or similar).
In addition, many games and demos will not run (or does the Medusa have
a compatibility mode (68000@8MHz) ?).

There is no other way how this can be implemented, since you cannot
get the precise name how a program is invoked (at least not portable).

5899. How to kill process group?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-13 14:25:00 UTC
From: benni@phil15.uni-sb.de
Message-ID: <2ehtvsINN2ue@coli-gate.coli.uni-sb.de>
Source record: 35401

Hello!

I've written software for remote login so that I can log into my TT over
the modem. It work's well, but there's still one BIG problem:

If the modem closes the connection DURING a login session - for example
because the other computer crashes - the last login shell remains working with
all it's subprocesses.

In this case, a "kill -1" should be sent to all processes that were started
after the last login.

I 've had a look at several manpages and learned that "killpg" would do
the job. With "ioctl" I found out that the process group ID is always
identical with the PID of the login shell (is this correct?).

But "killpg(pgid,1)" only kills the shell itself and NOT the "less", "elm"
or "gzip" that are running under that shell. It doesn't matter if these
processes are running in the foreground or in the background; they ALWAYS
stay alive. :-(

My simple question now: How can I kill ALL processes with ONE command?
Thanks for your help!

Benni

Keywords:

Howdy folks,

I've a question to all hardware-freax here:
How can I make a 2 MB-(or more)-520ST+ with Chips called 41256.
I've got 36 of these Chips free of charge from a PC-AT-Board.
My ST is an 520ST+, also a 1MB-machine.
I think using a soldering iron is not a problem for me, because
I think the soldering iron is the most imporant thnig for any
computeruser...;-).
And there is also another question of mine: How can I connect
a PC486 with the ST using the serial ports of them?
I tried to install Nortoncommanderlink on both of them, but
it was not working?
And my last question is about a HD-3.5"-Floppy on ST's: Is there
a cheap possibilty for doing that?

Many thanx to all, who want to answer me.
Hendrik

>> need it.

>I have just aquired an NEC MultiSync II, although it looks rather
>old.

>Am I right in thinking you've managed to connect this to your ST, if so how
>please?

I'm assuming all this is about getting switchable mono/colour on a multi-sync.
If not, just ignore...

I made my own switchbox a while ago, _without_ resitors. Basically, I used a
two position rotary switch with '4' poles. I connected the H-sync & V-sync
straight through to the monitor (not through the switch). The following
diagram should show how the RGB & MONO signals go through the switch.

```
(ST)MONO ---------o-----------o
| \
| S1/1 o------------------- RED (Monitor)
|
(ST)RED ---------+-----------o
|
o-----------o
| \
| S1/2 o------------------- GREEN (Monitor)
|
(ST)GREEN ---------+-----------o
|
o-----------o
\
S1/3 o------------------- BLUE (Monitor)

(ST)BLUE ----------------------o

(ST)MDETECT --------------------o
\
S1/4 o---------- 0v on ST DIN connector
```

o

Don't ask me about pin connections, I don't have my ST docs. handy. Also,
don't flame about how I've done this.... It works great for me!!!

Check if your monitor has an under/over-scan switch. You may need to use
that to get the picture the right size in mono mode.

Cheers, Steve

Does GCC support templates or exceptions yet? Last time I checked they
didn't,
but it has been awhile since I checked on this.

Turns out, it was a loose chip in one of the sockets. He hadn't pushed down hard enough the first time he tried reseating them. It's all been worked out now.

BTW I didn't ship it with anything in the drive. Most computers that I have seen come with not insert so I figured it was safe enough.

5907. DIGITAL AUDIO LIBRARY on a.a.u.e (NAUDIO.LZH)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-13 23:29:27 UTC
From: wallmann@backus.pu.informatik.th-darmstadt.de
Message-ID: <2eitsnINNkkj@rs18.hrz.th-darmstadt.de>
Source record: 35408
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Finally I managed to get this out on the net. It was sitting idly on my harddisk waiting to be released, but I had to send this to a friend to upload this on an intermediate machine.

Anyway...

```
----------------------------------------
NAUDIO Evaluation Version available
----------------------------------------
```

NAUDIO is the first and only (?) library for the ST/STE/TT/FALCON, that gives PURE Programmers full portable digital audio capability. Now you can incorporate digital sound effects in your own program, without much concern about the underlying hardware.

NAUDIO features 4/8 track Tracker software, for playing NaTracker and ProTracker modules. But of course you can also "only" play samples. The performance ranks with the best on all output devices. Even on the ST NAUDIO runs in "the background".

There is MUCH more to NAUDIO than just this. So download your evaluation version from your nearest server, as there are:

World: atari.archive.umich.edu atari/Newitems
(atari/Sound/Players)
Europe: ftp.uni-kl.de pub/atari/incoming
(pub/atari/other_demos)
Frankfurt: Fred Box: 06181-52941 Atari Area

there are also two sample NAUDIO applications, that demo NAUDIO, in the NAUDIEMO.LZH archive near the other archive.

5911. HELP! How 2 add HD to ancient 520ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-14 00:03:18 UTC
From: metalhed@kaiwan.com
Message-ID: <CI005J.C4u@kaiwan.com>
Source record: 35409

Hello there! I'm an old hand at computers, but my knowledge of Hard Drives on the Atari is minimal... I should soon be getting, soon...

1-4 RLL drives, or
1-2 RLL and 2 MFM drives.
(One RLL is definate, the others depend on what kinds of deals I can cut).
Mini-tower case with 200w power supply

Okay. I have an *original* 520ST, TOS 1.04, 1/2 meg RAM.
What *Exactly* do I need to get the HDs connected to my Atari, and get them formatted and running? I'm on a *tight* budget right now, so am looking for lowest cost way to do this.

I know I need a host adaptor and controller(s). Can I use IBM-type controllers? Or do I need Atari-specific ones? What about software? Is AHDI good enough to get started? IF not, what would you reccommend that I can anon FTP or otherwise download for free (or phone call cost)?

I understand you can put two controllers on one host adaptor? Can you put one MFM and one RLL controller? How reliable would RLLing an MFM drive be? Any good way to test on an IBM? (the MFMs would likely be coming from a friend across the continent from me, an IBM user, but he's could likely hook the drives up to his IBM and play around with /em before sending.)

Please get back to me, Email preferred to save bandwidth but here OK. Thanks in advance!

> Just curious what's the main changes between 2.3.3 and 2.5.5?

I can only speak for the C++ component, since I don't use C, and
the changes there have been phenomenal. 2.3.3 had some terrible
bugs, but 2.4.5 was MUCH better. 2.5.5 seems to have more bugs
though. 2.5.6 fixes most of those (maybe all - I worked around
them, so they don't show up anyway).

5913. Newdesk.inf question

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-14 02:47:50 UTC
From: pelletier@Nyongwa.CAM.ORG
Message-ID: <CI07rq.J5D@Nyongwa.CAM.ORG>
Source record: 35412

Perhaps someone here knows this:

I've installed "less" (the text file reader) in my newdesk.inf file.
I.e., I've got it set up so that I can double-click on a given
text file (with a standard extender) to read it with "less".

I only have one minor problem, which is that I would like to run
"less -C" instead of just "less". Is there a way to pass parameters
to a program in newdesk.inf? I tried a few things, to no avail.

Thank you for any help.

Yves

Not as fasr as I know. You could write a small loader that will run
instead then load less passing it a parameter.

|> Thanks for your help!

The problem is that every program can change its process group to
itself, putting it into its own group, or, the normal case, the shell
does this when running a program to enable job control. I don't see
any way to get this working. There should be a way to get all
processes that have this tty as its control terminal.

Look at the "Install Application" dialogue. There is a line where you can set initial parameters. Try this out and look where this will go in the line in newdesk.inf. I think this is the second field after the application name, i'm not sure. Then you can change the line for less accordingly. It works for me. As an alternative, you can set the environment variable LESS to the default options.

Sorry for re-treading old ground here...

I have a colour multisync monitor, (I think it's rebadged)
I think I might be able to use it with the ST in Mono or maybe
mono & colour modes. I hashed a cable together to try colour,
but no joy, just a wibbly vertical line appeared. I'm a bit
suspicious of the sync rates, but I'm no technician.

Connections were straight through, Atari RGB, Hsync & Vsync
and ground to same on the monitor. The monitor has 5 bnc's
and I have a VGA type cable for the monitor too which works
with a PC.

Anyone got any comments?

Monitor spec:
Resolution modes: 640x480, 400, 350
800x600, 1024x768, 1280x1024

Sync: Horizontal: 30-75 KHz
Vertical: 50-90 Hz, 25-45 (I) Hz

No problem, you're using newdesk.inf so I assume you have TOS >=2 ??

This is how to do it...

When you install the application (click on icon, then select Install Application... menu entry) you'll be presented with a dialog box with from the top...

Program Name: (I think thats what it is...)
Parameters:
Document type:

Just stick "-C " on the parameters line (the space is important) and all will come up smelling of roses.

Hope I explained that OK...

Ian

You don't say which desktop you're using? The falcon/multiTOS desktop allows
you to specify parameters to be passed in the install application dialog.
(I use this for auto-extracting archive files when you click on them)

>Hello. May someone tell me how to disable the bell that rings
>at each keystroke (in GFA if possible).

You have to modify the conterm variable directly (address: $484), at least I know of no other way of modifying the key click. In GFA, this would be something like:

```
' Disable key click
SPOKE &H484, PEEK(&H484) AND &HFE
' Enable key click
SPOKE &H484, PEEK(&H484) OR &H01
```

As you see, bit #0 of conterm switches the key click. Likewise, bit #1 switches the key repeat, and bit #2 switches the bell.

I hope you can use this info

What TOS version are you using? At least, TOS 2.06 and TOS 3.06
have a line for parameters in the dialog for installing
applications. In the German version, this line is just below the
title which indicates tha name of the application being
installed.
Be sure to enter a space after the last commandline argument,
otherwise it gets ligated to the name of the calling file. This
means, if you just enter "-C" (as opposed to "-C ") here, less
will get confused by being called with "less -Cfoo.txt", and not
be able to figure out you want to read foo.txt

How do I execute a program from GFA? I would like to
load a ttp program into memory, then call it when
needed. I need to know how to give it the required
parameters when executed. When I try this, it just
runs the ttp program, and displays it's help screen
as if it never received any baspage values.

Hardly because it is not released yet, all I do know is that its a
68030/50 and that's all, with a few minor modifications it is a faster
TT CLone. However the release date has been re-scheduled to a later date
so I am afraid I do not know.

>Board.

I think they listed the DSP96000 as DSP alternative for Medusa. This is not a DSP56002 compatible DSP (neither source or binary). It's much more powerfull with floating point support, 96 bit internal precission and multiple 32 bit bus's! This DSP is a real number chruncher, (almost) matching the Alpha chip's performance in many ways, even at lower clock rates!

So, the Medusa DSP is not a 'make it FALCON compatible' upgrade, more a number chruncing upgrade I guess....

I think it's mostly changes in the C++ end of things, as well as
squashing bugs and misc. improvements. 2.4.5 is the last Atari version
that will produce workable 68000 code though. :-(2.4.x add templates
to C++ (very handy!) and fix some nasty C++ bugs over 2.3.x

Get a null-modem cable from any good computer shop. Without knowing what you want to connect them for, however, I can't recommend which software you'll need....

>And my last question is about a HD-3.5"-Floppy on ST's: Is there
>a cheap possibilty for doing that?
System Solutions in the UK (address is in an earlier posting, I can't recall it from memory) supply a simple conversion for an HD drive on an ST. I made the change to my ST and it does work, although because of how it's done, it can be a bit unreliable when the machine is cold! I guess that's what happens when you drive the poor FDC at 16MHz ! ;)

Cheers, Steve

4.0 is the same vintage is 3.4 if you have a release version of MultiTOS,
some dev. versions were effectively AES 3.3 w/ multi-tasking extensions.

|> >
|>
|> Is that a brandnew SPARC or a second hand? Anyway, yes, SPARC is nice too!

Both SPARC systems have been new. I quoted the lowest prices available in
Germany (to my knowledge, but i don't believe there are any significantly
better offers around.

|> I mean...an INDY costs 5,000 U$D only...and THAT's REALLY nice :) if you're

In Germany, the INDY starts at approx 15000,- DM (incl. TaX). Usable standalone
systems are above 20000,-

|> I would agree, but that is not Atari's style now is it ;)

Atari did so with MiNT, the Multitos kernel. I Hope they come with an affordable
powerful system soon (better yesterday than tomorrow).

cheers,

Michael

If this TOS supports environmental variables, you can just set the variable
LESS to whatever command line arguments you desire. I use Neodesk 3, and it
works fine (LESS=-meqw, I think).

==> something might be wrong with these people: no legal TOS licence, i.e., a patched TOS, wrong advertisements on the clock speed (i repeat: the fastest 68040 available is a 40 MHz chip, nothing more).

BTW, the problems with the availability of powerful 68040's was one of the reasons of HP to prematurely drop its Motorola support in favour of their RISC technology. And Apple probably
has good reasons to switch to the POWER-compatible RISC chip, too...

AES 3.xx is the Falcon AES which is newer than AES 4.xx. AES 4.xx is the
one that comes with MTOS and while slightly older has more features -
mainly the ability to multitask. There is also 4.10 beta which is
documented in the Compendium but not in the HiSoft book.

vctec@westminster.ac.uk (Denesh Bhabuta) writes:

>I am thinking of installing MiNT on my hard drive (using the Distrib kit by
>Simon Gornall), and have a choice of installing all the binaries and libraries
>etc on a Minix XFS partition.

An excellent idea - watch out though, from memory minit.ttp is missing from
the install disk. (My copy of the dist kit is quite old, I don't know
if they've been updating it regularly or whether Simon has dropped out..?)

>What I want to know, is how stable this would be, and what size partition I
>should keep for this?

Well, my system looks like this :

```
asharak:/>df
Filesystem 1024-blocks Used Available Capacity Mounted on
a: 353 265 88 75% u:/ (ahem...)
c: 15286 10128 5158 66% u:/ (TOSfs, boot stuff)
d: 31935 25162 6773 79% u:/ (TOSfs, misc rubbish)
e: 102288 72288 30000 71% u:/ (TOSfs, working archives)
f: 63632 30791 32841 48% u:/ (MFS, /usr, /usr/local)
g: 123327 804 122523 1% u:/ (MFS, /tmp, etc)
h: 82856 49072 33784 59% u:/ (TOSfs, storage arch.)
```

The first two partitions are the TT's internal drive, and they contain
a minimal set of stuff to run plain TOS so I can trasnport the system.
My default environment is MiNT/MFS, and it's very stable.

>Or should I just scrap the idea, and install everything on TOS partitions? The
>good thing with a Minix XFS is the long filenames just like Unix.

You're missing one other thing - the newer versions of MFS are _much_ faster
than a TOS filesystem.

>...Is it advisable to put all these under a Minix partition?

As a general rule, yes. Most unix-derived software will handle the long
filenames and soforth quite happily - mind you, I've run CalamusSL off
an MFS partition without any drama.

>What are the pros and cons of using a minix partition, apart from the fact
>that I will not be able to access it without MiNT?

Pro : Speed, long filenames, soft and hard links
Con : can't read it without MiNT, occasional software incompatability

>Danny.

Definitely... To the original poster... get the hard drive! It'll make
your ST MUCH more useful!

> PS. I've only just got access to the 'net, so a big hello to everyone still

I have about 250M online (in four disks)... I backup to 1.64M floppies
using Diamond Back II -- its compression gets me about 2M/disk.
Luckily, I have a fair bit of disk space free... :-\ I'd love a
streamer, but there doesn't seem to be any decent software (hell, I'd
settle for tar!) that works with both TOS and MiNT, and TOS fs
partitions and minix fs partitions.

>the stack size?
>

Michel -

I bought Prospero several years ago, which had the advantage of
a (vast!) manual set. The trick to changing the default stack
size is to use a linker file. Now, the format of this file is
arguably the absolute worst I have ever encountered, but
one of the lines lets you define whatever stack size you want.
I don't know what came in the magazine-cover version. Is there
anything in the drop down menus in the workbench that walk you
through building a linker file? I haven't used it recently
but could dig up the manuals if needed... (Were there any
sample linker files included? I thought one of the sample
programs which came with the commercial version had one (I
think it helped me figure out what the manual was (poorly)
trying to say on this subject.))

Date: 1993-12-15 04:41:21 UTC
From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <93348.234121STIRRE31@MAINE.MAINE.EDU>
Source record: 35438

Hello. As the subject suggests, I'm having difficulties
with my SC1224. The volume decided to go wacky on me
one day. When I turn on my machine, the volume is
tolerable (yet louder than it should be). After awhile
of use, the volume is blaring and unbearable. Does
anyone know what could cause this? I am using it with
my STe. I have never had any problems before.
thanks,
scott tirrell

We use Force CPU-40 VME boards, and they run 68040s at 24 MHz. They
also have this enormous heat sink glued directly onto the '40 chip.
They had heat problems with the early '40s. The CPU-40s spew an awful
lot of heat, much more than CPU-30s.

When I think of a '40 running at 64 MHz, I get this picture in my
head of a red-hot horseshoe on a blacksmith's anvil :-)

>one that comes with MTOS and while slightly older has more features -
>mainly the ability to multitask. There is also 4.10 beta which is
>documented in the Compendium but not in the HiSoft book.

OK, 3.xx is newer than 4.xx (!). *But* the important question is 'Are
all features of 3.40 (say) in 4.1?' Or vice versa? Or neither? That iis
the important information that I have failed to find so far.

Both of the books (HiSoft and Compendium) use phrases like 'available in
AES >=3.3', but it is still unclear to me whether 4.1 > 3.3 or
3.3 > 4.1

Obviously, I can start writing some code and run them under the various
versions of the AES that I have, but I thought that someone might already
know the answer.

Dear Atarians,

I have got the ICD Link for use with my Hard Drive, and also got the utilities, but are version 6.0.8

Now I recall seeing version 6.2.4 at an Atari show, and have seen someone post a message about 6.2.3

No, I only got the Link about a month ago, and have this old version. So how do I go about getting the newer versions?

Are ICD on internet? If so, would someone kindly forward me there address.

Or is there any site on the net from wher I can ftp the latest utilities?

Thanks.

Danny.

>xbios formatter fails!).

Not necessarily. With drives that spin up very fast, it works fine. My A:
drive is a NEC 1037 - doesn't work. My B: (noisy Chinon) formats fine.

With critical drives, press "Retry" on the error message while the drive
still spins.

The bug in 1.04 is: The drive spin-up delay is done by a CPU loop, cutting
the delay in half at 16 MHz :-(

I'm curious which version of MiNT is being used in the setup? I've noticed
that I get a *lot* less crashes under pure MiNT with version 1.09 than
I did with 1.08 (and I'd imagine this could roll over within MTOS as
well)...

Luckily, with all that RAM you can dump in the Medusa, running MiNT and
MultiTOS (face it, if it's not MiNT/MultiTOS compatible, it probably
won't run on the Medusa at all) with it's new and improved AES is no
problem.

Unless, of course, you want to make the same mistake most PC owners
do... get a fast processor, and starve it for RAM (4M is NOT enough for
Windoze, let alone real operating systems like Linux with X and OS/2).

Danny:

First off, the Link has different software than is available publicly.
You need to upgrade by sending ICD $10.00 for the Link versions.

They are currently working on version 6.3.x. The last version available
on GEnie is 6.2.4. I don't know the difference between Link versions and
general ICDHost versions that they release to GEnie.

You can email them on GEnie at: ICDINC@genis.genie.com
They also have a BBS with they post their software to if you don't have
access to GEnie. I don't know if the software can be sent from GEnie.

Hope this is helpful!

Do you use the mfs XFSs? Does it run stable for you? I try each new
version as they come out on a.a., but they are always unstable - I get
intermittant "Exiting MiNT" errors on my MTOS (and thats with it running as
MINTNP.PRG - it bombs faster with it on MINT.PRG). Thats a real bummer
because I would _love_ to use the V2 filesystem - the 32MB limit is a pain.

BTW, I recall a that there was a way to increase the buffer size for
read/writes to Minix partitions - does anybody remember this, or were they
perhaps talking about something else (perhaps directory cacheing? something
else?)?

Hi Simon,

Depending on what you need to do with MIDI, GEM and TOS
may not work for you without major modifications.

I have developed a graphical front end, and new MIDI handlers
for the ATARI ST platform.

If you wish to check out my front end, I have uploaded an
icon editor to UMich, called icon.arc. The icon editor
doesn't have any MIDI functionality, but it is a good
demo of my front end.

I have can post a barebones MIDI recorder / THRU, with a
real-time keyboard display (61 keys, hardcoded to channel 1)
if you or anyone else is interested.

Things have been so busy at work, I have not been able to spend
time on the ST like I used to, recently...

And, I haven't creaked open my Sybex GEM programmimg book for
a couple years. It is in great condition, and since I never
plan to use it again, make me a small offer and it's yours!

I believe there is a public domain manual on GEM programming
(tutorial format) out there on the net somewhere also, but
I don't have the details. I think I may even have it online
here at work somewhere, and I'll look for it if you are
interested.

I back up to SCSI tape. The drive was cheap (albeit second hand, but they're fairly cheap new too), and the software is free and reliable. And I am told that the next version of Diamond Back supports tapes too. My QIC tape is one of the best invesments I have made for my Atari system.

>I have about 250M online (in four disks)... I backup to 1.64M floppies

I use gtar with TOS and with MiNT. I don't know about minix partitions; I would guess that it's OK. And if it isn't, you get the source, so you can fix it.

I too am wondering what this means in reality and I *HAVE* a
45 Mb hard disk on my Atari ST with TOS 1.0

I cannot have a partition greater than 16 Mb and people tell me that
disk access would be faster with a higher version of TOS but, when
what you are used to is floppy speed, it seems fast enough for me.

I think that careful planning of partitions and avoiding fragmentation
helps a lot.

Lexicor> Hmm..it goes via LAN to use the same Appletalk Connectors...however
Lexicor> I don't think you can interchange Mac-Atari if that is what you
Lexicor> are looking for.

So it uses the same physical cabling as LocalTalk, but can't print
on LocalTalked LaserWriters, can't use AppleShare fileservers and
can't use TCP/IP through a Kinetics FastPath etc. ?

Looks like someone should port CAP (Columbia AppleTalk Package) to
MiNT. I've built this on our Suns so they print to LaserWriters and
act as AppleShare fileservers, but I don't have the time (or disk
space) to do it myself.

5971. Floppy Disk Noise ??????? Help....

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-16 11:44:07 UTC
From: vctec@westminster.ac.uk
Message-ID: <CI4Ls7.5Jq@westminster.ac.uk>
Source record: 35465
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi again,

Another problem....I remember posting a similar message a few weeks ago, but did not receive any replies......so here goes again.... B-)

Since upgrading to TOS 2.06, my internal and external floppies have been making weird noises when accessed. Like a crunching, loud sound !!!

Now, I've asked a few experts in the fiels, namely System Solutions in the UK, and they told me that 2.06 was built for Hard Drives and High Dens floppies, so basically when the floppy drive is accessed, it looks for a high dens drive, and when it does not find one, it changes the step rate to accomodate the low dens floppy, and it keeps on doing this when the drive is accessed.

They said that they do not know of any patch program available that will keep the step rate to what it should be, but I recall reading on the net that there is one somewhere.

Anyone know where I can get it?

Any help would be appreciated.

BTW, I want to change to a high dens module soon, but the price I can not afford at the mo. I've heard that this months ST Doormat.....sorry ST Format will have a feature on building your own. It's supposed to be out today, so I'll go and buy it. Maybe I can build one of my own, without spending too much money.

Thanx in advance for people who reply.... ;-)

Danny.

hello, i need some information about ftp.

i need a program (tcsh-script) for ftp (i call it listdir).
now listdir should log me automatically in an ftp site, make a listing of
all files in the directories and subdirectoris, put them in one local file
and finally logoff.

first i wrote the following shell-script:
#! bin/tcsh
ftp <ftp-site>

then in the .netrc i put:
machine <ftp-site>
login anonymous
password petep@info.isbiel.ch
now my problem:
how can i force the ftp.program to create the listings?

any idea?

please mail to petep@info.isbiel.ch. i will post the solution later.

thanks in advance.

I have a few joysticks for sale...cheap...oh well, just repeated the subject message B-)

Anyway, I have :

The Bug,

Cheetah 125+

Quickshot II Turbo

Quickshot I (Yes, These too....but very cheap)

Cheetah Bollistick...for people who like the console type joypad

and also, a Snes joypad called Quickshot Intruder.

These are brand new and have never been used...I think they are shrink wrapped, so why not mail me and get one by Christmas.

Danny.

Unbearable performance when a partition fills up, and danger of
data loss due to bugs in GEMDOS, especially in the internal
memory handling ("folder problem").

I use gtar to backup my drive on floppies and to exchange files with
the workstation at school (for ftp...). It's very reliable, compresses
really well (with gzip) and works best with minixfs (soft links,
long filenames, etc..). Gzip is not too fast, that's true but then
floppies aren't that fast either. (I still wish the floppy driver was
interrupt driven so that I could overlap IO and CPU work, of course)

And moreover it also works with streamers and is free.

There are bugs in the memory manager so that you run the risk of wiping out much of your data on the disk. The risk is small on a per run basis. Most likely you will notice programs malfunctioning before you wipe out any data on disk. However, you probably don't want to go very long putting up with (say) a 0.001 change on each run that you will wipe out important infromation on your disk. (I used TOS 1.0 with a hard disk for a while and not much bad happened, but it was nerve racking.)

It uses the same physical cabling. I only said you most likely cannot
interchange MAC-Atari. You can print LocalTalked, Laser writers share
the same rpinter, same drives, same modems etc. etc. THAT is possible.

However there is no software driver to work with the MAC..but you could
call up Dragonware and ask them about it.

Well Atari state that if you are running a Hard Drive DON'T use any thing less than TOS 1.4..

I have been using TOS 1.4 for a number of years and I do agree with this statement, if you are using a Hard Drive with any thing less than TOS 1.4 then you have a hole in your head....

So Please upgrade to TOS 1.4, you will never regret it...

RM> well)...

I found 1.08 to be quite stable if I turn *off* memory protection. I have great difficulties with 1.09, but I am almost certain that this is gcc's fault as I get different kind of bugs when I change compilation flags/gcc versions.

Does anyone know which version of gcc that infact DOES make a good version of MiNT ? I've tried 2.4.5, 2.5.0, and 2.3.3 with no success :-(I even tried to recompile the PL41 libraries with the respective gcc-versions, but no success :-(((

Anyone willing to send me a purec compiled 1.09 if I send them a gcc-compiled 68030 mint-1.09 (Just to prove that I *am* capable of patching+compiling the thing...)

On a sidenote - is the newest PureC multiTOS compatible/friendly ? I've been long thinking of buying this, and I am especially tempted now that gcc is really acting up on me. But I definitely won't buy it if it doesn't work 100% with multiTOS. (It doesn't have to use all it features - I just want it to work without a hassle)

5986. GCC: Request for details of malloc()

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-17 00:30:10 UTC
From: aeg03@rrz.uni-koeln.de
Message-ID: <2equiiINN26c8@rs1.rrz.Uni-Koeln.DE>
Source record: 35481

Hello fellow hackers,

could anybody give me details about the way malloc() works in the MiNTlibs pl 35? Is there any tool to monitor what blocks are allocated and what are free? I have run into a problem, which I'll try to describe:

I have a TT with 8 MB of RAM (4 ST + 4 TT), running MultiTOS on the basis of MiNT 1.0. I use gcc 2.4.5 (plain C, no C++), and mintlibs pl 35. My application muses malloc() quite a lot: It allocates several arrays initially, among which there is an array of pointers to the key structs used in the simulation. These structs contain arrays, which makes them pretty large. When such a struct is actually needed, memory is allocated and the pointer is stored in the array. When the struct is no longer needed, that block is freed. Of course, the freeing does not occur in the reverse order of the allocating -- the typical memory fragmenting scenario so far. It should not be too bad, though, since the size of the allocated objects is constant so far.
To make things more complicated ;-), there is one function in my program that allocates a temporary array which it frees before returning. With the input I give to the program, this array tends to be huge (compared to the size of the structs mentioned above). The problem is, now, that this allocation starts failing after the program has run for a while. My estimates indicate, though, that the peak total size of allocated memory should still easily fit into the memory of the TT.
The most obvious thing to suspect was a memory leak, of couse. But there seems to be none. I hacked up wrapper functions for malloc() and free() that increment a counter upon successful allocation and decrement it upon freeing. After a fairly extended program run, during which allocation failures occurred, this counter was zero when the program exited. So I conclude there is no memory leak.
I now suspect that the problem originates from the way how malloc() is implemented by the mintlibs, or by the way MiNT handles memory allocation. It adds to my suspicion that, after a longer hacking session with several starts of editors and gcc, my program sometimes refuses to run altogether, printing the message "insufficient memory". The only way to fix that is rebooting, closing down all applications and restarting tcsh does not help.
Did anybody else make similar experiences? Are there any explanations for this behavior?

Many thanx for reading all this, and even more thanx for
following up!

Sorry to hear about the problems, but alas until I get some more cash I have
to rely on my old STE to develop Minixfs (donations of hardware would of
course help :-) You can up the cache sizes by editing 'config.h' (the place
should be obvious) and recompiling. If I ever release the binary config program
you wont need to recompile.
Steve.
PS This is a bit odd, it's the first time I've heard of such problems, are you
using MiNT 1.09, 1.04 had a few problems as I recall.

5988. Re: Floppy Disk Noise ??????? Help....

TOS 2.06 trys to read disks at a (I think) 2ms seek rate, whereas
normal 720K drives are only supposed to read at 3ms seek rate.

There is a patch for this on atari.archive.umich.edu

directory (Should be)

atari/Ste/ or atari/Diskutils/

the file should be in one or the other, and is called 'seekup.???'
(probably an LZH or ZIP). Hmmm, maybe I'll be luck and the system
won't crash if I try to look at my index file....

Wow, yep, it is in the atari/Diskutils/ directory - filename seekup10.lzh!

Bart:/

send ./Diskutils/seekup10.lzh
quit

(Just in case!)

I have used MTOS extensively since may and I have to say that I have had some crasheing but not as bad as people seem to be saying.

Sure alot of s/w does not work, but then there was no guarantee that it would. Besides, alot of s/w is being updated to cope with mtos/speedo etc now so its just a matter of upgrading.

IMHO :)

: helps a lot.

Thanks to all who emailed with advice about using TOS 1.0 with
a hard disk (apart from the guy who said I had a hole in my head).

I installed FATSPEED last night as someone suggested and it seems
to have made a difference in that there is now no pause before it
goes off to look for a file. Unfortunately, when I load Cubase, it
does some very quick disk access and then I have to stare at a
'busy bee' for a few seconds - I assume some sort of decompression
is going on. This also applies to other s/w I load.

Still it has speeded things up a bit in the loading of song and
arrangement files so I am grateful for the suggestion.

John.

If you must stick with TOS 1.0, there is one program you SHOULD have
(absolutely should). It is FATSPEED. It will increase your disk access
tremendously. You won't be used to floppy speed for long after that :-)
It should be available at atari.archive.umich.edu and other fine
FTP sites...

Rob

...I dunno if MiNT/minixfs works under TOS 1.0, but a minix partition in
TURBO mode flies even faster than a normal partition (FATSPEEDed or
TOS 1.4'd and above)...

Hi,

Quick question - does anyone know where I might get an official ATARI high density floppy drive from ? - preferable UK but I'm not too fussy ! :-) I know that System Solutions do one, but that's not an ATARI one and I don't want to have to cut the case on my Mega STe.

Thanks,

Martin

>happened, but it was nerve racking.)

Oops, you reminded me of one more thing. I addition to FATSPEED
(which will make using a hard drive bearable under TOS 1.0), another
very necessary (for sanity?) program to use under TOS 1.0 (well, most TOS's
anyways) is FOLDRXXX which will help avoid the (in)famous
"40-folder" bug. In later TOS's I think hitting this bug would produce an
error message - in earlier TOS's (like 1.0) this could corrupt part of the
disk, if I recall right...

This behaviour is known as a bug in MiNT's memory managing routines,
which is fixed by now int 1.09 plus some patches.

Hi!

It is not allowed to distribute the ICD-Utilities outside their BBS.
You are able to get the latest ICD-utils by connecting to one of their
BBS (not on the internet). Don't know the actual phone numbers (Ask you
Atari dealer).

Bye,
Wolfgang.

I use the Minix fs XFS under MiNT 1.08 (and 1.09 now); the 0.6 versions
are very stable, and I'm even using the strange ICD host utilities
(which have persistant bugs and their own way of doing things). I
haven't had a messed up filesystem yet with the 0.6 versions of the XFS.

BTW, this is on an ST with memory protection explicitly turned off (via
recompilation with no_mem_prot = 1 in one of the source files).

Cubase is shipped compressed with PFXPAK. Just get hold of PFXPAK and
unpack it. It's available from many ftps.

> chip I need to put in? Better yet, can anyone supply me with a schematic?

It might not be a missing chip after all. If you look into a couple of computer motherboards, some of them will have empty slots. I supposed this is because the designers were too lazy to take the slots out of a new revision and the empty slots are meant to be that way and the computer should still work fine.

I had to make a one-time adjustment to my SC1224 when I first bought it.
It can now display 50/60 with no flipping, as I think most can. Did you try
to adjust the vertical hold knob on the back?

6012. HELP: HP deskwriter + Spectre GCR??

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-19 01:10:02 UTC
From: yonder@netcom.com
Message-ID: <yonderCI9CKr.DCo@netcom.com>
Source record: 35259

Somebody _please_ help:

I'm trying to hook my 1040ST+SpectreGCR to an HP DeskWriter.

(1) Will it work? Please let me know if you have this working.

(2) How do I make it work? (hopefully the answer to (1) is yes!).

I've constructed a cable as described in appendix C of my Spectre docs: which is an Atari serial (DB25) to ImageWriter II (8-pin DIN) printer.

I configured spectre to use the serial port as the printer port under the "printer" menu.

My Spectre GCR is version 3.0.

I've loaded all the software from the deskwriter installation disks (release 2) -- including screen fonts and printer fonts.

symptoms: I go to print a document (in MS Word 4.0) and I can access the page setup and print resources fine. When the Spectre attempts to print, it looks like everthing is working fine (the hard disk is accessed, the "hit command-. to stop" dialogue comes up, and I can still move the cursor (now a stopped watch), but nothing ever happens at the printer. At this point I must reboot.

If you don't mind, please send e-mail. I'll be watching the group from time to time though too.

....Thanks Chris (yonder@netcom.com)

Source record: 35266
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi,

My recently purchased Falcon is exhibiting some strange behavior; I am curious if any other Falcon owners have had similar experiences:

1) The sound output is REALLY noisy, especially during boot-ups; nowhere near the advertised 'CD' quality (CD quality is rougly 96dB S/N ratio, and audibly, the Falcon is nowhere close to it)

2) The monochrome mode sometimes boots with a 'wrap-around' screen, similar to what some ST's experience. This also ocasionally happens after a video mode change (to monochrome).

3) All four colour modes and ST LOW mode have narrow white borders directly on the left and right sides of the display area, rougly 16 pixels in 640 horizontal rezolution, although these borders are not the same size on both sides.

Any comments are welcome!
Thanks,

Ok, followed most of that, basically the switch toggles the mono detect and
connects the PC<->ST RGB's together or all 3 to the ST mono line.

> Don't ask me about pin connections, I don't have my ST docs. handy.
> Also, don't flame about how I've done this.... It works great for

Don't worry, I'm not the kind of person to flame someone who's trying to help
me, then again I'm not the kind of person to flame someone. ;-)

I have the ST pinouts in the manual what I _do_ need are the NEC MII pinouts
(9-pin), as I have no manual for the monitor.

> Check if your monitor has an under/over-scan switch. You may need to
> use that to get the picture the right size in mono mode.

Erm, nope don't know, the NEC MultiSync II has a few switches on the back,
guess I'll just have to fiddle with them when I wire it up.

Christmas Greetings, -Paul-

This one probably won't fall within that category:
I have a Mega2 which has been upgraded to 4 last year. My dealer made it sound like he sold me a state of the art RAM expansion board, but it turned out to be a louzy piggyback job indeed. (so, beware of Atlantis, Groningen, Holland! :))
Anyway, I started losing one 2 meg bank and could find the flaw, no matter what I tried and how hard I piggybacked myself. Finally I decided to have it re-done (not by Atlantis) and finally I'm the proud owner of a Real Xtra RAm Expansion Card with two 1 meg SIMM's.
My advice: get it done the right way.

merry christmas,

Paul

6029. How do I write ISR's on a 1040ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-20 20:54:32 UTC
From: khan@obelix.gaul.csd.uwo.ca
Message-ID: <1993Dec20.205432.12358@julian.uwo.ca>
Source record: 35280

Hello everybody. I'm writing a program that interfaces to a Robot Arm controller via the serial port. What I need is to be able to detect if the program-defined Emergency Brake key is pressed at any time during execution (say, the space bar). So when I get a keyboard interrupt I want to check if the key is the space bar and stop all motors immediately if it is.

The keyboard is hooked up to the MFP which sends interrupts at level 6. I used the appropriate entry in the EVT to point to my routine on interrupt, but it was never called. I know I'm missing something, and the book on Atari ST Internals didn't seem to help. Ideally, I'd like my routine to be one of the User Interrupt Vectors (say 80) in case the system uses the auto-vectoring routines, but how could it be invoked asynchronously?

I may also find it necessary to write an interrupt for information coming from the serial port instead of polling for responses from the Robot Arm. Information on that would also be appreciated.

Any ideas, suggestions, or information is welcome. You can get in touch with me at khan@gaul.csd.uwo.ca. I need help on this stuff as soon as possible.

Thanks in advance,

Itrat Khan

Anyone out there have a pointer to detailed documentation of the asm
command in gcc? (ST specific of course). I've tried to look at some of
the include files that use it (e.g. osbind.h, linea.h) and had some success.
Now I am getting some wierd compiler errors and I don't know what to do about
them. Any help would be greatly appreciated!

Thanks,
Bill

Source record: 35285

some days ago i posted the following problem:

> i need a program (tcsh-script) for ftp (i call it listdir).
> now listdir should log me automatically in an ftp site, make a listing of
> all files in the directories and subdirectoris, put them in one local file
> and finally logoff.

i was surpriesed, how many answers i got. some of the writers asked me why
i need that, because almost every ftp-site has their NEWFILES and INDEXFILES.
well, i became the moderator of the Atari archive on our school. unfortuna-
tely it runs on a novell server. i prefer working on our suns, so the only
way to access to the ftp archive is via ftp. thats why i'm writing now some
tools to create the index and news files automatically.

many thanks to everyone how replied to me, specially to:
Ate Brink, Georg Thimm, Girardin Luc, Georg Kraemer, Stampf Nicolas,
Ken Yap, Christian Masopust, Konstantinos XONIS, Robert Anisko,
Wolfgang Ley, Thomas Gusset, Richard Czech,

here also some of the solutions i got:

Try using ncftp. I know you can get a file directly from the command
line. You may be able to feed it from a script. Ask archie where
ncftp 1.6 is kept.

---
define a macro in your .netrc called 'init' (executed after connection
establishment) which does the dir command.

---
ftp can use a inline script like
```
#! bin/tcsh
ftp [ftpsite] <<END
dir * [localfilename]
bye
END
```

---
i got even some programs which creates a whatsnew-file i don't post them
here because they are to big or because i don't know if the author would
be pleased to see his program published.

To capture your session, you may want to redirect the output to a file.
Something like this:

```
ftp 128.252.135.4 > ftplog
-OR-
ftp 128.252.135.4 | tee ftplog
```

The first form should redirect everything to "ftplog" (but unfortunately not to the screen).
The second form should redirect everything to "ftplog" AND to the screen (I say should as I've had variable results on different systems, but I usually pipe my "archie" sessions to a file this way so it should work).

A complete description (incl. example) is included in the file /pub/README on ftp.tu-clausthal.de (139.174.2.10). Access via FTP, FSP (port 21) or email ("mail-server@ftp.tu-clausthal.de").

```
#! bin/tcsh

ftp -n <<ftpcmds >output
open ftp.isbiel.ch
user anonymous password petep@info.isbiel.ch
cd atari
verbose
dir sound
dir unix
dir grafik
:
:
:
quit
ftpcmds
```

Dear friends,

Hi again. :-)

I recently saw in a magazine.....ST Doormat...sorry ST Format (Just what David Encil from Titan Designs said...stuck with me), an advert by Marpet, the memory upgrade specialist !!! and of Forget Me Clock fame.

It said that the Xtra RAM board was now available for the STe, and required TOS2.06....support for earlier versions being available soon. And only 60 pounds for the unpopulated board. Not bad I thought, and gave them a call to find out more.....

My main query was about where the board would fit....and this was what is sad for me. It is supposed to sit on the 68000.

Now my 2.06 installed in my STe, is via a switcher board by Compo, which itself sits on the 68000. The only other expansion being for a PC emulator, which I was considering buying. Otherwise the board is a dead end for any other expansions onto the 68000.

I was told that the 2.06 would have to be socketed onto the motherboard and my 1.06 ROMs removed. Great, I thought.....the 1.06 are actually soldered onto the motherboard. and I am no genius at soldering :-(

Is anyone familiar with this board by Compo? Is there any way that I can keep the board as well as the install the Xtra RAM board? Marpet told me that they were incompatible. If so, then how would I install any PC emulator, as they require an adaptor to fit over the 68000? I can chuck the existing switcher board and go for a seperate adaptor for an emulator, but I thought that they too fit over the 68000.

What about accelerators.....don't they too fit over the 68000?

Any ideas on this topic would be helpful.

Danny.

It sounds like you need to put your ST in a tower case to help expand it. call System Solutions and discuss options with them.

I already have a tower case Iain.

The problem is not one of space, but of where the things go... After installing
a Xtra RAM board on top of the 68000, there is no provison of installing
anything else onto the 68000, hence no Compo TOS Switcher, PC emulator, or even
accelerator.

Danny.

Not really. Unless you want to BLOAD the file and relocate the
code yourself.

>> If not, how does one USE the EXEC command? I can't quite figure it out.

>I am having the same problem. Any information would be much appreciated!
>Thanks

The EXEC command has always worked for me for loading and running
programs right away. Just use

EXEC 0,"FOO.PRG","",""

to run "FOO.PRG" from the current directory. You may include
drive and path info in the second argument to EXEC as well.
There's one snag I can think about, which doesn't have anything
to do with the EXEC command directly. The problem is, the program
to be EXEC-ed needs some memory, of course, and you have to free
that before any attempt to EXEC can be successful. The GFA
interpreter (and compiled GFA programs) get all available memory
from the system upon startup (to be precise, they get the largest
contiguous chunk, but with SingleTOS, that's all memory almost
always), and they don't give any of it back to the OS unless you
instruct them to. In the interpreter, use the RESERVE command.
When preparing compiled programs, put the compiler instruction
$m<num. of bytes> at the beginning of your code. You'll have to
estimate how much memory your program actually needs, which can
be tricky or even impossible if you use arrays dimensioned
depending on user input or the like.
So, to be able to EXEC a program of any appreciable size from the
interpreter, you have to do something like:

RESERVE -100000 !free up 100000 bytes for program to be EXEC-ed
EXEC 0,"FOO.PRG","",""

and in a program for compilation:

' Hopefully, this GFA code needs no more than 500000 bytes...
$m500000
...

```
EXEC 0,"FOO.PRG","",""
```

Btw, the problem of no memory being available to the OS also gets you when trying to ~RSRC_LOAD() larger resource files, or when trying to MALLOC() chunks of appreciable size.
Btw2: Frequent calls of RESERVE can sometimes mess up certain versions of the interpreter when used with newer TOS versions (particularly TOS 2.06), so save your work frequently when developing code and doing lots of test runs.

>any more ram, can I solder some simms in there? or piggyback 1

Strange, all MEGA ST2's I've upgraded had room for more chips
(just put them and some resistors and stuff in and solder).

All the 520 STF's and STFM's too had extra space for upgrade
(both the ones with 256 kbits and the ones with 4x256 kbits)

Maybe you can "piggy-back" them like in the old 520 ST's
(but that's a real tricky job and can go very wrong :-)

Yes, you can buy any SCSI unit (of similar physical dimensions) and stick it
in. However, you might try tightening up the mounting screws (with a bit
of blue loctite), installing some nylon bushings, and perhaps getting a
quiet fan. These little things can really quiet down a noisy drive.

I believe the patch you're looking for is called BUTFIX (or BUTTFIX,
or maybe BFIX). Anyway you should be able to find it on A.A.

Another option is the ACC extender (I also forgot what it's called,
MAXIFILE or something???) It has the button fix built in and you
can toggle it on or off...

Any of you STacy owners out there have an AdSpeed in it? I'm curious as to what you did (or what was done) to get it to fit.

Exiting as though it was called with the -H option is probably the default behavior of the ttp in question (presumably some sort of archiver). Options have to be passed in the third argument of the EXEC command. The little trick here is that the first character of the command line has to be the length of the commandline. This is due to way GEMDOS expects things. Anyway, here's an example of which I think it will work (untested, that is):

```
commandline$="e// foo.zoo"
EXEC 0,"zoo.ttp",CHR$(LEN(commandline$))+commandline$,""
```

If zoo.ttp and foo.zoo are in the working directory, zoo should be fired up and unpack foo.zoo. Btw, the detail with the first character encoding the length of the command line is easy to get if you either have TOS docs of some sort (Profibuch) to look up the Pexec() call, or the GFA docs, but then, the GFA folks themselves forgot that at least once, namely when writing the GEM shell for their compiler. So, if you ever wondered why you get a "file not found" alert box when starting the interpreter from the shell (menu.prg) after specifying a working file, you now know what to do to fix that...

6052. Converting AdSCSI drive to plain SCSI (Was Re: Replacing a Noisy Seagate/ICD Drive)

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-22 09:57:05 UTC
From: C.J.Ridd@cs.bham.ac.uk
Message-ID: <CIFKz6.ID3@cs.bham.ac.uk>

I've got a Maxtor SCSI drive attached to my ST using an ICD AdSCSI
board... When I get a Falcon, what do I need to do to use the drive?

Basically, how do I bypass the AdSCSI board, and extend the SCSI bus?

Thanks!

6053. Got an RLL HD--now need controller, Host Adaptor, specs!

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-22 10:34:49 UTC
From: metalhed@kaiwan.com
Message-ID: <CIFMq1.F3G@kaiwan.com>
Source record: 35306
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

The Odyssey continues...

Picked up an RLL HD--70 megs after factory-bad sectors, $50 US, pretty good deal. What I need now is this...

What host adaptor and controller should I get? I have heard ICD's host and Adaptec controllers are best, but I'd like options...

Where can I get them, and for how much? Used is FINE, I need *cheap*, hoping to get controller/host adaptor/software/power supply for under $100 total.

Plus, I assume that some of the software will be loaded into RAM--I'm still on a 520ST, and don't want to sink money into any RAM upgrades that I can't take with me to my Falcon (which I should be getting next year some time)...

Also, will need the specs on the drive I have--cyl, heads, sectors/track, et al... Here's the make/model:

Fujitsu Limited drive, 86 megabytes.

Part #B03B-4805-B003A#NT
Serial #209224
Revision #B9

On the side is what looks like a UPC bar code, with the #001350 209224

If anyone has the specs for this drive so I can format it and check it out, I'd appreciate it, or the # for Fujitsu so I can call them and find out.

Lastly, I'm assuming that I can plug the controller and drive into the Falcon's SCSI-2 port, correct? This is important, so that I can take the drive(s) with me when I move up...

Thanks!

Dear Netters,

Here's wishing you all the best in the festive season, and for the coming New Year.

Christmas means different things to different people.....presents for some..... religion for others.......and party time for the rest.

I am not a Christian, but do believe in God. As this is a celebration for the birth of Jesus, I too celebrate Christmas. I believe that all the religions teach the same thing, and so there should be no difference between people of different religions.

Basically, all religious teachings come from the one great power, so all religions must be the same....just preach it differently.

So, let's celebrate Christmas, with love and goodwill for one another.

Peace.

Danny.

Chris,

Basically, you take out the ADSCSI and sell it or keep it aside (maybe even leave it in there), after unplugging all connections from the board to the drive and power supply.

Get scsi leads....I've forgotten what they are called....50 pin something I think, that will plug into the back of your drive, and lead out of the box. The connectors that lead out of the box, can go into the spaces left by the ADSCSI board sockets.

That's it, really....and don't forget to plug in the power into the drive.

Next, you will need a scsi2 -> scsi lead that will allow you to plug in and go.

That's it.

Please do wait for more replies to this topic, to be sure though. I have never done the conversion and am speaking from what I think you have to do. If I am wrong, I'm sure you will get a lot of replies and I'll get a lot of flames :-)

Mail me if you want the proper name of the lead....and where you can get one.

Danny.

me.

TOS 1.4 does indeed increase hard disk read/write speeds, on a TOS 1.0 or 1.2 ST you can get almost the same read/write speeds (and free space calculations) using a program called FATPSEED, it takes up about 25k of RAM and I have been using it for about 2-3 years, works perfectly.

You can have bigger partitions than 16mb on TOS 1.0 and 1.2, you have to use what are called BGM partitions though. Bear in mind though that if you want to boot from one of your partitions then your boot partition has to be smaller than 16mb. On TOS 1.4 and upwards this limit is increased to 32mb.

All this is using ICD utilities, I'm not sure about the Atari utils.

Christmas Greetings, -Paul-

In which case you use FATSPEED which increases access to almost what 1.4 is like. All this talk of anything below 1.4 being unreliable is a load of bollocks IMHO. I think I would know, I've been using 1.2 with my HD for the last 2-3 years and have had no major problems.

Sheesh! Relax Rog. GENEVA comes with an upgrade patch to bring Neodesk
to v.3.04 so it works with *GENEVA*. If you don't have GENEVA, you don't
need the upgrade. If you buy GENEVA you GET the upgrade.

Gribnif support is excellent, and their products are top notch. Get the
facts before you get excited, ok?

You'll also need some driver software. You can use the Atari HD drivers, but
not the ICD ones that came with your adSCSI board; they will not work if
they do not see such a board. If, like many people, you would prefer ICD
to Atari, then you'll need to ICD Pro Utilities. They are somewhere in
the region of 40 quid, including the CleanupST that would have been missing
from the set you got with the board.

I think you just lose the ability to access some files and generally they start
to disappear.

This problem is soon zapped however if you run ICD HD utilities as it has the
extra folder allocation built into the HD driver.

From the sound of your Reply, you know more than Atari !!....

Atari have stated on many times that any one using a Hard Drive should NOT
BE USING ANY THING LESS THAN TOS 1.4...

Is this not clear to any one, or should I get the real Atari posting,
may be that will get into some of you thick heads....

There are some 2 Pages of Fixes in TOS 1.4, a lot more than the FATSPEED
one, like Move Files, Rename Folders, set step rates on A or B Disk drives,
Keyboard Resets....

So get real and Upgrade to TOS 1.4, it will not break the Bank...???

6070. Re: Questions About TOS 1.0 and HDs

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-24 13:22:06 UTC
From: tmoffitt@bfsec.bt.co.uk
Message-ID: <ClJJsu.n36@bfsec.bt.co.uk>
Source record: 35322

Guys, I'm relatively new to this group and I'm afraid I have to admit to using a hard disk with my ST. It's a 'Third Coast Technologies' 32Mb HD. The ST is a 520 STFM with 4Mb RAM, SM124 monitor. Like I say, I have to admit to using it for about the past 4 or 5 years. I've always wondered why it takes so long to start up, especially since the memory upgrade.

I didn't realise until I read a message on this group that, with early versions of TOS, every time a program is loaded, ALL memory is cleaned out first. Therefore the more memory you have, the longer it'll take to start an application. By the way, I have TOS 1.02 - yeah, I know - upgrade ASAP.

I also noticed that it is pretty slow with the HD. I heard on this group yet again about speed problems with early TOS versions.

OK, so what version of TOS should I go for ? I notice some people are saying that you should upgrade to 1.4, but I see magazines advertising version 2.06 with a switch for switching back to your old version (which I think might be useful for some things). I'd be willing to part with 65 UKP for the 2.06 upgrade, but is this the best way for me ?? How much is a 1.4 upgrade and where in the UK could I get it ??

If anybody has any suggestions/advice/experience, etc, could you please EMAIL me direct since our system only holds 2 or 3 days worth of postings, and today is my last working day until 4th January...

Thanks in advance...

Terry

My understanding is that there are three different conditions a Mega2 motherboard can be in (pertaining to memory upgrades).

1. 2mb installed, traces/holes available for additional 2mb.

2. 2mb installed, traces available for additional 2mb, but holes solder filled, thus making it a real pain to install chips (for these, one of the separate board memory upgrades is recommended). My memory is not perfect on this, perhaps even the traces are not available.

3. 4mb installed, 2mb disabled (rare). Apparently several folks have opened up their Mega2's to find 4mb with one bad chip in the second 2mb. Atari would check the Mega4's, and if they were bad would cut a trace or resistor or something and test it as a Mega2. If it passed, it went into the box. These lucky few can locate the bad chip, replace it, reconnect the disabling part, and have a Mega4.

I also remember something about hamstrung MMU's being used in some of the Mega2's, which would not allow you to address anything above the first 2mb. New MMU's are fairly cheap though.

I think most Mega2's fall into category 1 above, so memory upgrades should not be a problem for most. I need to open up my Mega2 and check it one of these days :-).

Not at all, go to a local electronic store and get a small pump to suck
it up (you need a soldering iron to heat it up too of course).
The pump is hand-driven (with a spring and a lock) with a teflon tip.
Costs not more than about $10....

Did Atari ever release the source code to their TOS operating system for 1040 ST? I know that they sell Falcons with an upgraded operating system. I have the Atari 8-bit DOS listing. Does Atari (if they haven't done it yet, which I doubt) ever have plans to release it? Of course, I got the BIOS listing in the Developer's kit.....

Anybody ever hook a keyboard up to their ST without buying $100 commercial interface? I mean, a decent keyboard, like the Mac one :-)

Thanx for any info. - Mike Winters

The subject pretty much says it all--need to hook up one currently-owned RLL drive to my 520ST, can use either...

One ACSI-->SCSI host adaptor and one SCSI-->RLL controller, OR...

One cheap (even bad HD) Atari Megafile drive, which will work too as it has the p/s, controller and host adaptor I need.

Thanks!

U need a CABLE!

A "SCSI-2" to "50-pin ribbon connector" (like the one on the HD!)

The adSCSI board is useless with Falcons when Falcons comes with
a SCSI-controller onboard!!

You can still be bitten, as was I, if you don't allocate enough buffer space for additional folders (in the ICD driver, using hdutil). I originally asked for 250 extra folders, and managed to hit that during a long session. I now have it set to 1000. Anyway, my point is, don't be squeamish or frugal with that particular setting. Remember that you only have to _visit_ XXX folders, you don't have to be that deep in the directory structure.

Merry Xmas!!!

I have had a couple of email confirmations that the #2 configuration also has no traces for the extra memory banks (something that I suspected and noted in my original post). Solder suckers are mighty handy devices (though I prefer braid myself), but not helpful for this type of motherboard. One of the email respondents labeled this type the "bastard board". The name fits :-).

> without having to muck around with the EXEC command?
>
> If not, how does one USE the EXEC command? I can't quite figure
it
> out.

Using exec() is the only way I know, and it's quite easy.

```
Setmouse 2 ! Sets mouse cursor to busy bee
Reserve 5120 ! Reserve 5k for GFA and free the
rest
Err%=Exec(0,Exe$,Param$,"") ! Execute, err% is errorlevel
returned
Reserve ! Get back freed memory
```

Basically 'Setmouse 2' to turn the mouse to a busy bee, that's just my preference, otherwise it will stay as an arrow, I havn't worked out how to turn it off, 'Hidem' doesn't work. Next 'Reserve 5120', this releases all memory held by GFA except 5k (this has to be a multiple of 256 bytes), why 5k well you need some storage for your varibles, obviously increase this if you have more and/or bigger
variables.

Then you have the exec() itself, err% will be any errorlevel returned from the program you have executed. The zero (load and execute) parameter is the load type, there is also 3 (load only) but AIUI that doesn't work for one reason and another, there are also now some others like 6 for launching apps in multitasking mode but I'm not too sure on that and they are probably unsupported in GFA.

Exe$ is the name (and path if you want) of the program you want to execute, Param$ is any parameters you want to pass to the program, this is strange as it is a pascal type string rather than C as instead of having a terminating null byte it needs the first character to have an ASCII value of its length, ie. use something like: `Exe$=Chr$(Len(Exe$))+Exe$`

The last parameter is supposed to be the environment but I'm not sure how to set that up so I just leave it blank. Then the last instruction is 'Reserve', this gets back all the memory you released to the program that you wanted to execute.

There is an example of all this in the V3 manual.

Christmas Greetings, -Paul-

This is only true with TOS 1.0-1.2, no longer needed with TOS 1.4 and above..

Its now only folders that are active, not just visited..

NOTE: This FOLDERxxx uses lots of memory and with a 1000, would you have any
memory left...???

No, he just knows what his own experience has shown him, much like I did.
Until I bought my Falcon I was quite happily using a 65meg Supra and 44meg
syqyest drive on my ST with Tos 1.2. I used Fatspeed and got adequate
performance. I never bothered upgrading my Tos for a variety of reasons,
like it wasn't broken, it gave adequate performance, I intended to buy a
new machine, I didn't need any of the fancy desktop widgets in the later
versions (I don't use the desktop much), and basically I couldn't be
bothered.

>Is this not clear to any one, or should I get the real Atari posting,

Sorry, no bollocks. The problems are there, no doubt about that, and are perhaps the source of your implied "minor" problems...?

The situation with TOS 1.0 nd 1.2 depends rather a lot on what you do with your system, how long it's on between resets (or power-off), and what "fix-programs" are used. Minimum should be FOLDERxxx.PRG when using a harddisk, since this reduces the risks by increasing the statistical time before the system gets confused with 'many' folders being 'opened' in the course of a session. As mentioned, FATSPEED (and other cache-type software) makes access times much more acceptable for the user.

It should work with any (parity-check-disabled) SCSI unit, though multiple drives might be tricky. Not a lot of space in there to experiment with :-) (Have you taken one apart?) Easier to get the Link or some such DMA/SCSI and freely attatch external units.

> Also, have you ever noticed, the place on the

It's a Mega bus (if you're refering to the side port without a connector). The Stacy is essentially a midget-Mega w/o blitter in disguise.

Doubt it. I've seen commented disassembled listings (at least two different versions of TOS in the older Internals books.

Folderxxx is needed with all TOS versions. It is less of a problem with
TOS 1.04 and later, but I would still recommend using it. I had my Falcon
crash the other day with the message "Out of Internal memory - Use
Folder100.PRG to get more - System Halted".
I believe this is somehow related to the number of malloc() calls in a
session, but not sure.

Is the difference between an SH205 and a MegaFile 20 that the Megafile is RLL instead of MFM??

You can somtimes use MFM drives on RLL adapters, to get about a 45% size inc.

Can a SH205 Driver Board be upgraded to RLL with a new rom??

If so, can somebody either copy, or send me a rom??

Here is how to hook up a Microsoft bus mouse to an ST. Bus mice are rare, however. Most PC mice are serial, and cannot be used on the ST. Amiga mice work fine, requiring only a trivial switching of wires internally (no cutting or soldering).

---begin included text---

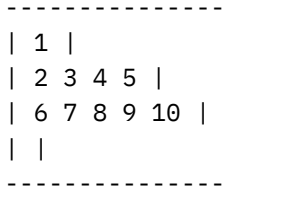
Well, here is how to connect a Microsoft Mouse to an Atari ST. (520/1040) The Atari has a 9-pin D-type connector. The Microsoft Mouse has a rather strange connector on the end. To prevent having to cut the mouse cable up, I made this adaptor. If you still can't follow it, please let me know and I'll try to redescribe it. This does work for me. I've been using it for 6 or so months now with no problems at all. It does take some soldering skills, so if you're not so hot at soldering, find a friend to help.

As far as I know, this does not effect your Atari's warranty. However, I have not asked Atari. :-)

Atari ST		Microsoft Mouse ST		expected signal
1	5	XB		
2	3	XA		
3	8	YA		
4	9	YB		
5	N/C	N/C		
6	2	Left button		
7	N/C	+5VDC (N/C)		
8*	6	and also tie to pin 1	Ground	
9	7	Right button		

* = I am not sure why I have pins 6 & 1 tied together, but it does work.

The Microsoft mouse connector looks like this. This is the solder side, with the leads pointing up.



If you can not use the connector, the pins are numbered as follows. This
is the connector side from the Microsoft Mouse plug:

```
/------------\ This is a view at the front of the connector.
/ Blank "KEY" \ It is where the plug from the mouse would be.
/----------------\ The pin labeled 'n' is not connected.
| n 4 X 8 | The place labeled 'X' is filled, and does not
| 9 7 1 2 | have a pin.
| 5 6 |
\ /
\------------/
```

Have fun!

Jeff

6094. PurePascal in English yet?

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-27 05:23:47 UTC
From: umcordes@cc.umanitoba.ca
Message-ID: <2flrh3$okg@canopus.cc.umanitoba.ca>
Source record: 35345

Has PurePascal been translated into English yet? (I mean the entire thing, online help and all) If not, is there any plan to? I would love to use PP instead of HighSpeed... but I couldn't live without English online help!

Another question: any plans to add debugging utilities in HSPascal (maybe like the ones in PP?)? Does anyone have v1.6 or newer? What are the features it offers over 1.5?

Thanks!

Unfortunately, there is not going to be an English verion of Pure Pascal (or Pure C) anytime soon. The reason is that when Pure Software, founded by Borland's Atari developers when Borland (foolishly) decided to drop Atari support, obtained the right to continue developing languages on the basis of the Borland stuff under some very silly conditions. One condition is that Pure is not allowed to supply any English online help, another is that they're not allowed to call their languages "Turbo".
I have little idea what made Borland dictate these silly conditions to their former developers, someone once wrote they had a "messy divorce". The best thing I can think of in order to make English Pure docs possible one day is calling or writing letters to Borland and bitch at them for their destructive attitude.

DB> What about accelerators.....don't they too fit over the 68000?
DB>
DB> Any ideas on this topic would be helpful.

I think the latest TOS2.06 upgrades are piggied onto the Glue chip and
do not require any soldering at all .

Not an ideal solution I know since ,like me, you already have the Compo Board
but it would be a way round your problem . And since you already
have the ROM chip's it isn't that expensive (@30 UKP).

My Board however doesn't sit on top of the 68000 but merely has some wires
tapped into certain pin's on it . Assuming we have the same Board maybe the
same could be done with your's but I would think that would cost more
than the former if you have to get someone else to do it.

> perhaps the source of your implied "minor" problems...?

I have had no problems, major or minor, that I can attribute to TOS 1.2 in the several years I have been using it. I use FatSpeed, ICD hard disk software (which includes a folder fix), Neodesk, Universal Item Selector 3, FormDoIt, Warp9, and HSModem1. The only reason I would upgrade to TOS 1.4 is to take advantage of the 32mb partition size (over 16mb in TOS 1.2, given 512k disk blocks, which I prefer). If I were to use TOS 1.4, I would be able to get rid of FatSpeed, but have to include at least one TOS 1.4 bug patch program (poolfix? Something like that). There may be more. Thus, IMHO TOS 1.2 is perfectly workable, even with hard disks involved. Using TOS 1.4 gives you potentially bigger "normal" partitions and possibly a very small increase in access time. One still has to run various auto folder "fixit" programs with 1.4, they are just different from those used for 1.2 :-).

So, I would not worry about upgrading from 1.2 to 1.4. IMHO, they are mostly the same, and little auto folder programs (which are needed or desired with either version) can fix the problems each has. Affecting this opinion is the fact that I am a diehard Neodesk fan. I have not looked at a GEM desktop in ages :-). I highly recommend this package no matter what TOS is used.

Of course, I think the original poster was talking about upgrading from TOS 1.0, which is a good idea. There are plenty of 1.2 ROMs out there, owned by folks who upgraded to 1.4. I would consider getting a set of them. If such cannot be found, upgrading to 1.4 is also reasonable (about $50 or so, I seem to remember). They are essentially functionally equivalent, given a sprinkling of little auto folder programs.

Just my $0.02.

Get G+Plus. Much better, worth the money. Call Toad (1-800-448-TOAD).
As for GDOS, you might find it on atari.archive.umich.edu included with
some other package (maybe Opus?). I was under the impression that Atari
relaxed the distribution rules for GDOS somewhat. I could be wrong on this.

Another tack is to buy a used copy of Microsoft Write for the ST (I have
seen it in bargin bins for $10). It includes GDOS (the program itself is
hideously buggy). If you posted a request, you would probably get some
takers.

Finally, since Speedo GDOS has recently come out, you might find used copies
of G+Plus out there.

Hope this helps.

Source record: 35359

I have have recently obtained a OLIVETTI DM296 9 pin colour printer.
I have been able to get it to print b/w text and graphics with no problems
as it is fully FX-80 compatible. However I would like to give its colour
ability a spin.
I understand that the epson JX-80 command set has facilities for
colour printing and I also know that my printer is also JX80 compatible.
Is there any Atari printer drivers or programs that support the JX-80 ??
Preferably I would just want recommendations for ftp'able software
that would do the job. (I got the printer for very cheap and only want
to test its capabilities before deciding whether to keep it or sell it.)

Thanks.....

Source record: 35360

Having been a loyal 8-bitter since 1983, I finally (!) got a 520ST and an SF354 external drive. Immediately disassembling the SF354 (before even using it) brought me the revelation that it is a single-sided drive just like the 520ST's internal job. I ALSO noted that it uses standard 4-pin power and FD interface (like the, ugh, PC's). It has a simple power supply and interface adapter inside the case. I was wondering if anyone has ever tried or would anyone know if a standard 720K or 1.44Mb double-sided drive mech could replace the SF354's, and if so, would TOS recognize the drive (either the single OR double density version)??

I really can't stand the idea of using a single-sided drive with such a fantastic machine. Can anyone help?

Thanks much,

They do, the only difference is, that earlier production runs have the
holes solder filled, while later ones had them pre-filled with wax,
preventing the solder from filling the holes.

There's two versions of the Mega ST 2 board, one really is the Mega 4
board with 2 MB unpopulated (with or without solder filled holes), and the
other really is a 2 MB board (no holes, no traces).

They claim to have plans to add debugging capabilities to HighSpeed, along with OOP extensions. But they've been saying that for about 2 years now. Version 1.6 has been out for over a year, and there's no sign of any imminent update.

I've had v1.6 for a long time now, but I'm not sure I can give you a complete answer to your question of what it offers over v1.5, since the enhancements were of negligable importance to me. They improved math coprocessor support, added local symbols for use with assembly-level debuggers, extended support fo Hisoft's Devpak 3, fixed a few small bugs (and added a few new ones).

The only thing that did anything for me was that turning local symbols on made it possible to use the code profiler (for C) that I think I got off the a.a. archives. Version 1.5 executables just bombed with it.

The v1.6 update is available at a reasonable price here in the U.S. from Oregon Research ($10 and your master disks, I believe).

By the way, I don't fault HiSoft or D-House (the developers in Denmark responsible for HighSpeed) for not pursuing enhancements more agressive-ly. Development dollars are at a premium, especially in a shrinking market, and there just may not be enough of us die-hard Pascal program-mers left to make it worth their while (unfortunately). Personally, I consider Atari programmers extremely lucky to have 2 Turbo-compatible options available on the platform (there's only 3 on the PC, unless Microsoft completely dropped QuickPascal, then there's only 2). If it weren't for HighSpeed, I'd have left the Atari 2 years ago.

You can replace the drive with any 720k drive without problems. The
Atari uses a standard shugart bus. It's also possible to modify the ST
so that 1.44M drives can be used. The main idea is to double the clock
rate of the Floppy Disk Controller to 16MHz. There are kits for doing
this. Ask your local dealer. I'm using a 1.44M TEAC drive
since many years without problems. Nice, because the transfer rate is
500kb/s instead of 250kb/s.

Small Points:
If anyone could possibly bare to use a HDD on a TOS 1.0 machine (I have seen it done. EUCH!) I can recommend that they use MiNT with MINIX FS ALL THE TIME. Having used 1.2 in this environment, I can say that there will be >2 fold speed increase!!

As for bugs in 1.4. $#!+ !!! I have just upgraded, and it it lush beyond all belief. (And it has a nice raster thing!)

LO> I have an old upgraded 520 STM with a problem...
LO> No disk-drive or hard-disk icons at boot (only trash-can :-)
LO> Test-kit reports DMA-counter error, but replacement of DMA, GLUE
LO> and MMU didn't help at all. All other functions work, but no disks :-
Try checking the following:
Corrupt Desktop.inf file.
Faulty DMA cable.
Faulty Host adapter.
Faulty floppy drive.
Faulty WD1772 controller.
Faulty Yamaha YM-2149.
Faulty sockets on the MMU and/or Glue chip.

Sorry that I can't be more precise but as far as I am aware all of these faults could cause the problem you are experiencing.

I've had it happen on me when the DMA cable was plugged into the wrong port on my host adapter and it took me a little while to figure it out ;-)

>Is the difference between an SH205 and a MegaFile 20 that the Megafile
>is RLL instead of MFM??

The only difference is the front label. The hardware is identical.

MF30 and 60 used RLL. The board is different to the MF20/SH205 board, so
updating just the ROM is a no-go.

Well 1.2 works fine for me. I just get annoyed when people say 1.4< and HD is
a disaster when I've been running fine for 2-3
years.

> Is this not clear to any one, or should I get the real Atari posting,
> may be that will get into some of you thick heads....

I don't know what to say to being called a 'thick head' for no reason.

Ok, next time someone disagrees with me I'll call them a 'thick head'.

> There are some 2 Pages of Fixes in TOS 1.4, a lot more than the
> FATSPEED one, like Move Files, Rename Folders, set step rates on A or B
> Disk drives, Keyboard Resets....

Move files, keyboard reset and rename folders are all added features, I don't
need to set step rates and if I did there are probably plenty of PD programs to
do
it.

> So get real and Upgrade to TOS 1.4, it will not break the Bank...???

I am a student. Also difficult to find 2 chip sets of 1.4, which means
'rejigging' some of the ST to accept a 6 chip set. Then you have to run new
patches for any new bugs added in 1.4 (no I can't offhand remember what they
are).

New Year Greetings, -Paul-

6124. GEM Programming Question

Newsgroup: comp.sys.atari.st.tech
Date: 1993-12-31 08:04:17 UTC
From: Desmond_Liu@mindlink.bc.ca
Message-ID: <35451@mindlink.bc.ca>
Source record: 35376

I'm trying to write VDI text into a window, but I'm having trouble trying to make the program resolution independent. I need to know how to determine the number of lines I can write into my GEM window.

Presently, I compute the number of vertical pixels available inside my window using wind_get(). Next, I compute the character cell height of my text using vqt_attributes(). Then I divide the latter value into the former value.

When I write out my VDI text, how do I determine how many further pixels down vertically I need to add to the "y" value in v_gtext(handle,x,y,string) in order to print on the next line? Currently I was adding the value of the character cell height from vqt_attributes() but this doesn't work too well (it's actually cutting off my descenders in the letters "g", "j", etc.).

Thanks in advance.
